
Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Active
Core Processor	AVR
Core Size	8/16-Bit
Speed	32MHz
Connectivity	I²C, IrDA, SPI, UART/USART, USB
Peripherals	Brown-out Detect/Reset, POR, PWM, WDT
Number of I/O	34
Program Memory Size	16KB (8K x 16)
Program Memory Type	FLASH
EEPROM Size	1K x 8
RAM Size	2K x 8
Voltage - Supply (Vcc/Vdd)	1.6V ~ 3.6V
Data Converters	A/D 16x12b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 85°C (TA)
Mounting Type	Surface Mount
Package / Case	44-VFQFN Exposed Pad
Supplier Device Package	44-VQFN (7x7)
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/atxmega16c4-mhr

7. Memories

7.1 Features

- Flash program memory
  - One linear address space
  - In-system programmable
  - Self-programming and boot loader support
  - Application section for application code
  - Application table section for application code or data storage
  - Boot section for application code or boot loader code
  - Separate read/write protection lock bits for all sections
  - Built in fast CRC check of a selectable flash program memory section
- Data memory
  - One linear address space
  - Single-cycle access from CPU
  - SRAM
  - EEPROM
    - Byte and page accessible
    - Optional memory mapping for direct load and store
  - I/O memory
    - Configuration and status registers for all peripherals and modules
    - Four bit-accessible general purpose registers for global variables or flags
  - Separate buses for SRAM, EEPROM and I/O memory
    - Simultaneous bus access for CPU
- Production signature row memory for factory programmed data
  - ID for each microcontroller device type
  - Serial number for each device
  - Calibration bytes for factory calibrated peripherals
- User signature row
  - One flash page in size
  - Can be read and written from software
  - Content is kept after chip erase

7.2 Overview

The Atmel AVR architecture has two main memory spaces, the program memory and the data memory. Executable code can reside only in the program memory, while data can be stored in the program memory and the data memory. The data memory includes the internal SRAM, and EEPROM for nonvolatile data storage. All memory spaces are linear and require no memory bank switching. Nonvolatile memory (NVM) spaces can be locked for further write and read/write operations. This prevents unrestricted access to the application software.

A separate memory section contains the fuse bytes. These are used for configuring important system functions, and can only be written by an external programmer.

The available memory size configurations are shown in “Ordering Information” on page 2. In addition, each device has a Flash memory signature row for calibration data, device identification, serial number etc.

7.3 Flash Program Memory

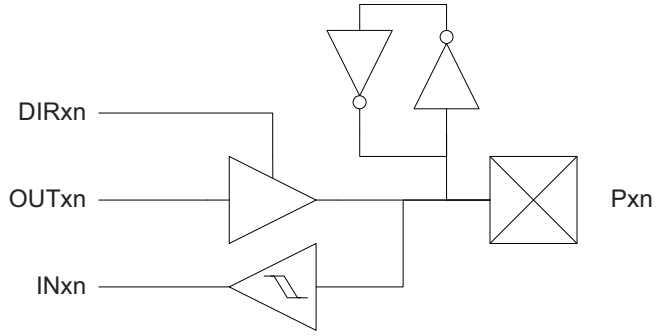
The Atmel AVR XMEGA devices contain on-chip, in-system reprogrammable flash memory for program storage. The flash memory can be accessed for read and write from an external programmer through the PDI or from application software running in the device.

All AVR CPU instructions are 16 or 32 bits wide, and each flash location is 16 bits wide. The flash memory is organized in two main sections, the application section and the boot loader section. The sizes of the different sections are fixed, but

14.3.4 Bus-keeper

The bus-keeper's weak output produces the same logical level as the last output level. It acts as a pull-up if the last level was '1', and pull-down if the last level was '0'.

Figure 14-4. I/O Configuration - Totem-pole with Bus-keeper



14.3.5 Others

Figure 14-5. Output Configuration - Wired-OR with Optional Pull-down

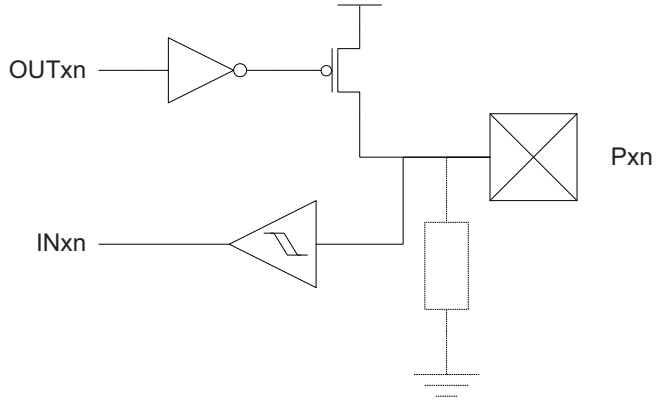


Figure 14-6. I/O Configuration - Wired-AND with Optional Pull-up

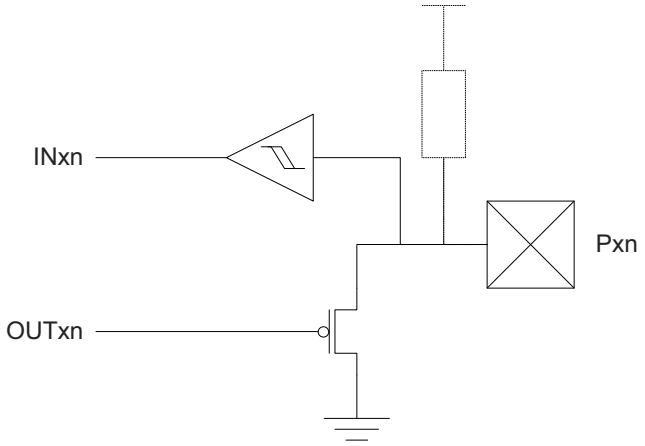


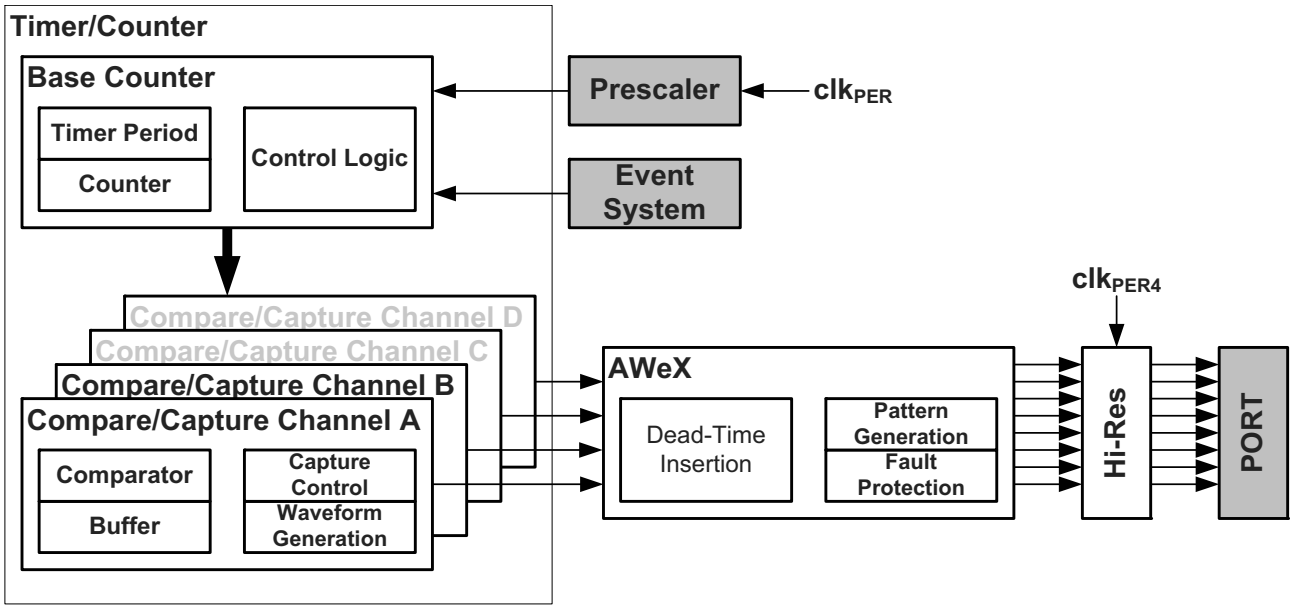
Only Timer/Counter 0 has the split mode feature that split it into two 8-bit Timer/Counters with four compare channels each.

Some timer/counters have extensions to enable more specialized waveform and frequency generation. The advanced waveform extension (AWeX) is intended for motor control and other power control applications. It enables low- and high-side output with dead-time insertion, as well as fault protection for disabling and shutting down external drivers. It can also generate a synchronized bit pattern across the port pins.

The advanced waveform extension can be enabled to provide extra and more advanced features for the Timer/Counter. This are only available for Timer/Counter 0. See “AWeX – Advanced Waveform Extension” on page 36 for more details.

The high-resolution (hi-res) extension can be used to increase the waveform output resolution by four or eight times by using an internal clock source running up to four times faster than the peripheral clock. See “Hi-Res – High Resolution Extension” on page 37 for more details.

Figure 15-1. Overview of a Timer/Counter and Closely Related Peripherals



PORTC has one Timer/Counter 0 and one Timer/Counter1. PORTD, and PORTE each has one timer/counter 0. Notation of these are TCC0 (time/counter C0), TCC1, TCD0, and TCE0 respectively.

20. USB – Universal Serial Bus Interface

20.1 Features

- One USB 2.0 full speed (12Mbps) and low speed (1.5Mbps) device compliant interface
- Integrated on-chip USB transceiver, no external components needed
- 16 endpoint addresses with full endpoint flexibility for up to 31 endpoints
  - One input endpoint per endpoint address
  - One output endpoint per endpoint address
- Endpoint address transfer type selectable to
  - Control transfers
  - Interrupt transfers
  - Bulk transfers
  - Isochronous transfers
- Configurable data payload size per endpoint, up to 1023 bytes
- Endpoint configuration and data buffers located in internal SRAM
  - Configurable location for endpoint configuration data
  - Configurable location for each endpoint's data buffer
- Built-in direct memory access (DMA) to internal SRAM for:
  - Endpoint configurations
  - Reading and writing endpoint data
- Ping-pong operation for higher throughput and double buffered operation
  - Input and output endpoint data buffers used in a single direction
  - CPU can update data buffer during transfer
- Multipacket transfer for reduced interrupt load and software intervention
  - Data payload exceeding maximum packet size is transferred in one continuous transfer
  - No interrupts or software interaction on packet transaction level
- Transaction complete FIFO for workflow management when using multiple endpoints
  - Tracks all completed transactions in a first-come, first-served work queue
- Clock selection independent of system clock source and selection
- Minimum 1.5MHz CPU clock required for low speed USB operation
- Minimum 12MHz CPU clock required for full speed operation
- Connection to event system
- On chip debug possibilities during USB transactions

20.2 Overview

The USB module is a USB 2.0 full speed (12Mbps) and low speed (1.5Mbps) device compliant interface.

The USB supports 16 endpoint addresses. All endpoint addresses have one input and one output endpoint, for a total of 31 configurable endpoints and one control endpoint. Each endpoint address is fully configurable and can be configured for any of the four transfer types; control, interrupt, bulk, or isochronous. The data payload size is also selectable, and it supports data payloads up to 1023 bytes.

No dedicated memory is allocated for or included in the USB module. Internal SRAM is used to keep the configuration for each endpoint address and the data buffer for each endpoint. The memory locations used for endpoint configurations and data buffers are fully configurable. The amount of memory allocated is fully dynamic, according to the number of endpoints in use and the configuration of these. The USB module has built-in direct memory access (DMA), and will read/write data from/to the SRAM when a USB transaction takes place.

To maximize throughput, an endpoint address can be configured for ping-pong operation. When done, the input and output endpoints are both used in the same direction. The CPU can then read/write one data buffer while the USB module writes/reads the others, and vice versa. This gives double buffered communication.

26. ADC – 12-bit Analog to Digital Converter

26.1 Features

- One Analog to Digital Converter (ADC)
- 12-bit resolution
- Up to 300 thousand samples per second
  - Down to 2.3µs conversion time with 8-bit resolution
  - Down to 3.35µs conversion time with 12-bit resolution
- Differential and single-ended input
  - 12 single-ended inputs
  - 12x4 differential inputs without gain
  - 8x4 differential input with gain
- Built-in differential gain stage
  - 1/2x, 1x, 2x, 4x, 8x, 16x, 32x, and 64x gain options
- Single, continuous and scan conversion options
- Three internal inputs
  - Internal temperature sensor
  - AV_{CC} voltage divided by 10
  - 1.1V bandgap voltage
- Internal and external reference options
- Compare function for accurate monitoring of user defined thresholds
- Optional event triggered conversion for accurate timing
- Optional interrupt/event on compare result

26.2 Overview

The ADC converts analog signals to digital values. The ADC has 12-bit resolution and is capable of converting up to 300 thousand samples per second (ksps). The input selection is flexible, and both single-ended and differential measurements can be done. For differential measurements, an optional gain stage is available to increase the dynamic range. In addition, several internal signal inputs are available. The ADC can provide both signed and unsigned results.

The ADC measurements can either be started by application software or an incoming event from another peripheral in the device. The ADC measurements can be started with predictable timing, and without software intervention.

Both internal and external reference voltages can be used. An integrated temperature sensor is available for use with the ADC. The AV_{CC}/10 and the bandgap voltage can also be measured by the ADC.

The ADC has a compare function for accurate monitoring of user defined thresholds with minimum software intervention required.

29. Pinout and Pin Functions

The device pinout is shown in “Pinout/Block Diagram” on page 4. In addition to general purpose I/O functionality, each pin can have several alternate functions. This will depend on which peripheral is enabled and connected to the actual pin. Only one of the pin functions can be used at time.

29.1 Alternate Pin Function Description

The tables below show the notation for all pin functions available and describe its function.

29.1.1 Operation/Power Supply

V_{CC}	Digital supply voltage
AV_{CC}	Analog supply voltage
GND	Ground

29.1.2 Port Interrupt Functions

SYNC	Port pin with full synchronous and limited asynchronous interrupt function
ASYNC	Port pin with full synchronous and full asynchronous interrupt function

29.1.3 Analog Functions

ACn	Analog Comparator input pin n
ACnOUT	Analog Comparator n output
ADCn	Analog to Digital Converter input pin n
A_{REF}	Analog Reference input pin

29.1.4 Timer/Counter and AWEX Functions

OCnxLS	Output Compare Channel x Low Side for Timer/Counter n
OCnxHS	Output Compare Channel x High Side for Timer/Counter n

29.1.5 Communication Functions

SCL	Serial Clock for TWI
SDA	Serial Data for TWI
XCKn	Transfer Clock for USART n
RXDn	Receiver Data for USART n
TXDn	Transmitter Data for USART n
SS	Slave Select for SPI
MOSI	Master Out Slave In for SPI
MISO	Master In Slave Out for SPI

Mnemonics	Operands	Description	Operation	Flags	#Clocks
ICALL		Indirect Call to (Z)	PC(15:0) ← Z, PC(21:16) ← 0	None	2 / 3[1]
EICALL		Extended Indirect Call to (Z)	PC(15:0) ← Z, PC(21:16) ← EIND	None	3[1]
CALL	k	call Subroutine	PC ← k	None	3 / 4[1]
RET		Subroutine Return	PC ← STACK	None	4 / 5[1]
RETI		Interrupt Return	PC ← STACK	I	4 / 5[1]
CPSE	Rd,Rr	Compare, Skip if Equal	if (Rd = Rr) PC ← PC + 2 or 3	None	1 / 2 / 3
CP	Rd,Rr	Compare	Rd - Rr	Z,C,N,V,S,H	1
CPC	Rd,Rr	Compare with Carry	Rd - Rr - C	Z,C,N,V,S,H	1

Table 33-5. Current Consumption for Modules and Peripherals

Symbol	Parameter	Condition [1]		Min.	Typ.	Max.	Units
I_{CC}	ULP oscillator				0.8		µA
	32.768kHz int. oscillator				29		
	2MHz int. oscillator				85		
		DFLL enabled with 32.768kHz int. osc. as reference			115		
	32MHz int. oscillator				245		
		DFLL enabled with 32.768kHz int. osc. as reference			410		
	PLL	20x multiplication factor, 32MHz int. osc. DIV4 as reference			290		
	Watchdog timer				1.0		
	BOD	Continuous mode			138		
		Sampled mode, includes ULP oscillator			1.2		
	Internal 1.0V reference				175		
	Temperature sensor				170		
	ADC	16ksps V_{REF} = Ext ref			1.2		mA
			CURRLIMIT = LOW		1.0		
			CURRLIMIT = MEDIUM		0.9		
			CURRLIMIT = HIGH		0.8		
		75ksps V_{REF} = Ext ref	CURRLIMIT = LOW		1.7		
		300ksps V_{REF} = Ext ref			3.1		
	USART	Rx and Tx enabled, 9600 BAUD			11		µA
	Flash memory and EEPROM programming				4		mA

Note: 1. All parameters measured as the difference in current consumption between module enabled and disabled. All data at V_{CC} = 3.0V, Clk_{SYS} = 1MHz external clock without prescaling, T = 25°C unless other conditions are given.

33.1.5 I/O Pin Characteristics

The I/O pins complies with the JEDEC LVTTL and LVCMOS specification and the high- and low-level input and output voltage limits reflect or exceed this specification.

Table 33-7. I/O Pin Characteristics

Symbol	Parameter	Condition		Min.	Typ.	Max.	Units
I_{OH} (1)/ I_{OL} (2)	I/O pin source/sink current			-20		20	mA
V_{IH}	High level input voltage	V_{CC} = 2.4 - 3.6V		0.7*Vcc		V_{CC}+0.5	V
		V_{CC} = 1.6 - 2.4V		0.8*V_{CC}		V_{CC}+0.5	
V_{IL}	Low level input voltage	V_{CC} = 2.4- 3.6V		-0.5		0.3*V_{CC}	
		V_{CC} = 1.6 - 2.4V		-0.5		0.2*V_{CC}	
V_{OH}	High level output voltage	V_{CC} = 3.3V	I_{OH} = -4mA	2.6	2.9		
		V_{CC} = 3.0V	I_{OH} = -3mA	2.1	2.7		
		V_{CC} = 1.8V	I_{OH} = -1mA	1.4	1.6		
V_{OL}	Low level output voltage	V_{CC} = 3.3V	I_{OL} = 8mA		0.4	0.76	
		V_{CC} = 3.0V	I_{OL} = 5mA		0.3	0.64	
		V_{CC} = 1.8V	I_{OL} = 3mA		0.2	0.46	
I_{IN}	Input leakage current I/O pin	T = 25°C			<0.01	1	µA
R_P	Pull/buss keeper resistor				25		kΩ

Notes:
1. The sum of all I_{OH} for PORTA and PORTB must not exceed 100mA.
   The sum of all I_{OH} for PORTC, PORTD, and PORTE must for each port not exceed 200mA.
   The sum of all I_{OH} for pins PF[0-5] on PORTF must not exceed 200mA.
   The sum of all I_{OL} for pins PF[6-7] on PORTF, PORTR, and PDI must not exceed 100mA.
2. The sum of all I_{OL} for PORTA and PORTB must not exceed 100mA.
   The sum of all I_{OL} for PORTC, PORTD, and PORTE must for each port not exceed 200mA.
   The sum of all I_{OL} for pins PF[0-5] on PORTF must not exceed 200mA.
   The sum of all I_{OL} for pins PF[6-7] on PORTF, PORTR, and PDI must not exceed 100mA.

33.1.13.5Internal Phase Locked Loop (PLL) Characteristics

Table 33-23. Internal PLL Characteristics

Symbol	Parameter	Condition	Min.	Typ.	Max.	Units
f_{IN}	Input frequency	Output frequency must be within f_{OUT}	0.4		64	MHz
f_{OUT}	Output frequency (1)	V_{CC}= 1.6 - 1.8V	20		48	
		V_{CC}= 2.7 - 3.6V	20		128	
	Start-up time			25		µs
	Re-lock time			25		

Note: 1. The maximum output frequency vs. supply voltage is linear between 1.8V and 2.7V, and can never be higher than four times the maximum CPU frequency.

33.1.13.6External Clock Characteristics

Figure 33-3. External Clock Drive Waveform

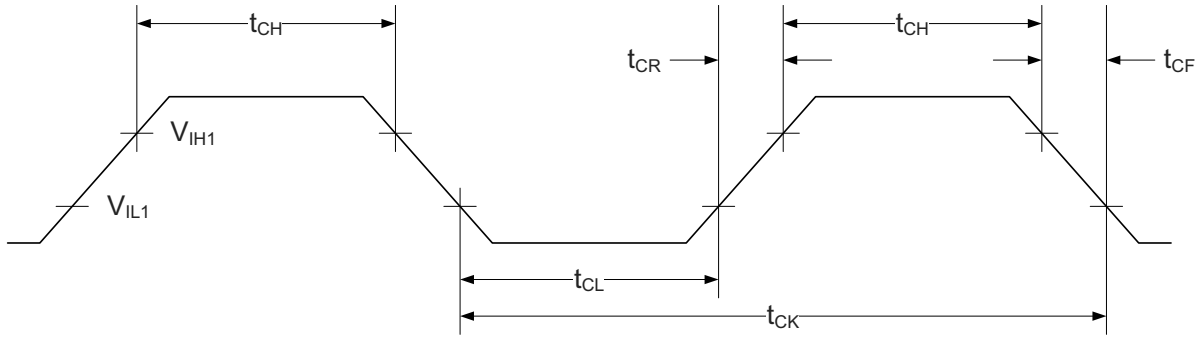

Table 33-24. External Clock used as System Clock without Prescaling

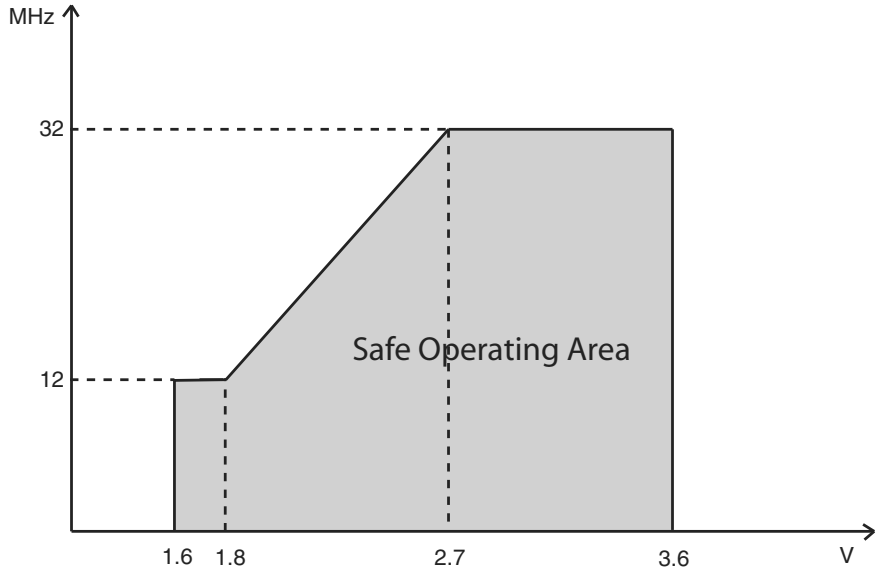
Symbol	Parameter	Condition	Min.	Typ.	Max.	Units
$1/t_{CK}$	Clock frequency(1)	V_{CC} = 1.6 - 1.8V	0		12	MHz
		V_{CC} = 2.7 - 3.6V	0		32	
t_{CK}	Clock period	V_{CC} = 1.6 - 1.8V	83.3			ns
		V_{CC} = 2.7 - 3.6V	31.5			
t_{CH}	Clock high time	V_{CC} = 1.6 - 1.8V	30.0			
		V_{CC} = 2.7 - 3.6V	12.5			
t_{CL}	Clock low time	V_{CC} = 1.6 - 1.8V	30.0			
		V_{CC} = 2.7 - 3.6V	12.5			
t_{CR}	Rise time (for maximum frequency)	V_{CC} = 1.6 - 1.8V			10	
		V_{CC} = 2.7 - 3.6V			3	
t_{CF}	Fall time (for maximum frequency)	V_{CC} = 1.6 - 1.8V			10	
		V_{CC} = 2.7 - 3.6V			3	
Δt_{CK}	Change in period from one clock cycle to the next				10	%

Note: 1. The maximum frequency vs. supply voltage is linear between 1.8V and 2.7V, and the same applies for all other parameters with supply voltage conditions.

Figure 33-8. Maximum Frequency vs. V_{CC}



33.2.6 ADC Characteristics

Table 33-37. Power supply, Reference, and Input Range

Symbol	Parameter	Condition	Min.	Typ.	Max.	Units
AV_{CC}	Analog supply voltage		V_{CC}- 0.3		V_{CC}+ 0.3	V
V_{REF}	Reference voltage		1		AV_{CC}- 0.6	
R_{in}	Input resistance	Switched			4.5	kΩ
C_{in}	Input capacitance	Switched			5	pF
R_{AREF}	Reference input resistance	(leakage only)		>10		MΩ
C_{AREF}	Reference input capacitance	Static load		7		pF
Vin	Input range		0		V_{REF}	V
	Conversion range	Differential mode, Vinp - Vinn	$-V_{REF}$		V_{REF}	
	Conversion range	Single ended unsigned mode, Vinp	-ΔV		V_{REF}-ΔV	

Table 33-38. Clock and Timing

Symbol	Parameter	Condition	Min.	Typ.	Max.	Units
Clk_{ADC}	ADC clock frequency	Maximum is 1/4 of peripheral clock frequency	100		1800	kHz
		Measuring internal signals		125
