

Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "<u>Embedded -</u> <u>Microcontrollers</u>"

Details

E·XFI

Product Status	Obsolete
Core Processor	C251
Core Size	8/16-Bit
Speed	16MHz
Connectivity	EBI/EMI, I ² C, Microwire, SPI, UART/USART
Peripherals	POR, PWM, WDT
Number of I/O	32
Program Memory Size	32KB (32K x 8)
Program Memory Type	OTP
EEPROM Size	-
RAM Size	1K x 8
Voltage - Supply (Vcc/Vdd)	2.7V ~ 5.5V
Data Converters	-
Oscillator Type	Internal
Operating Temperature	0°C ~ 70°C (TA)
Mounting Type	Surface Mount
Package / Case	44-LQFP
Supplier Device Package	44-VQFP (10x10)
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/tsc87251g2d-l16ce

Email: info@E-XFL.COM

Address: Room A, 16/F, Full Win Commercial Centre, 573 Nathan Road, Mongkok, Hong Kong

Pin Description

Pinout

Figure 1. TSC80251G2D 40-pin DIP package

Signals

Table 2. Product Name Signal Description

Signal Name	Туре	Description	Alternate Function			
A17	0	18th Address Bit Output to memory as 18th external address bit (A17) in extended bus applications, depending on the values of bits RD0 and RD1 in UCONFIG0 byte (see Table 13, Page 20).				
A16	0	17th Address Bit Output to memory as 17th external address bit (A16) in extended bus applications, depending on the values of bits RD0 and RD1 in UCONFIG0 byte (see Table 13, Page 20).				
A15:8 ⁽¹⁾	0	Address Lines Upper address lines for the external bus.	P2.7:0			
AD7:0 ⁽¹⁾	I/O	Address/Data Lines Multiplexed lower address lines and data for the external memory.	P0.7:0			
ALE	0	Address Latch Enable ALE signals the start of an external bus cycle and indicates that valid address information are available on lines A16/A17 and A7:0. An external latch can use ALE to demultiplex the address from address/data bus.	_			
AWAIT#	I	Real-time Asynchronous Wait States Input When this pin is active (low level), the memory cycle is stretched until it becomes high. When using the Product Name as a pin-for-pin replacement for a 8xC51 product, AWAIT# can be unconnected without loss of compatibility or power consumption increase (on-chip pull-up). Not available on DIP package.	_			
CEX4:0	I/O	PCA Input/Output pins CEXx are input signals for the PCA capture mode and output signals for the PCA compare and PWM modes.	P1.7:3			
EA#	I	External Access Enable EA# directs program memory accesses to on-chip or off-chip code memory. For EA# = 0, all program memory accesses are off-chip. For EA# = 1, an access is on-chip ROM if the address is within the range of the on-chip ROM; otherwise the access is off-chip. The value of EA# is latched at reset. For devices without ROM on-chip, EA# must be strapped to ground.	_			
ECI	0	PCA External Clock input ECI is the external clock input to the 16-bit PCA timer.	P1.2			
MISO	I/O	SPI Master Input Slave Output line When SPI is in master mode, MISO receives data from the slave peripheral. When SPI is in slave mode, MISO outputs data to the master controller.	P1.5			
MOSI	I/O	SPI Master Output Slave Input line When SPI is in master mode, MOSI outputs data to the slave peripheral. When SPI is in slave mode, MOSI receives data from the master controller.	P1.7			
INT1:0#	I	External Interrupts 0 and 1 INT1#/INT0# inputs set IE1:0 in the TCON register. If bits IT1:0 in the TCON register are set, bits IE1:0 are set by a falling edge on INT1#/INT0#. If bits IT1:0 are cleared, bits IE1:0 are set by a low level on INT1#/INT0#.	P3.3:2

Bit Number	Bit Mnem	ionic I	Description				
7	CSIZE TSC87251G2D		On-Chip Code Memory Size bit ⁽¹⁾ Clear to select 16 KB of on-chip code memory (TSC87251G1D product). Set to select 32 KB of on-chip code memory (TSC87251G2D product).				
	TSC8025 TSC8325	1G2D F 1G2D \$	Reserved Set this bit when	writing to UCC	ONFIG1.		
6	-	F	Reserved Set this bit when writing to UCONFIG1.				
5	-		Reserved Set this bit when writing to UCONFIG1.				
4	INTF	۲ ۲ ۲ ۲	Interrupt Mode bit ⁽²⁾ Clear so that the interrupts push two bytes onto the stack (the two lower bytes of the PC register). Set so that the interrupts push four bytes onto the stack (the three bytes of the PC register and the PSW1 register).				
3	WSE	3	Wait State B bit ⁽³⁾ Clear to generate one wait state for memory region 01:. Set for no wait states for memory region 01:.				
2	WSB	1# \	Vait State B bits	5			
1	WSB)# () }	Select the number of wait states for RD#, WR# and PSEN# signals for external memory accesses (only region 01:).WSB1#WSB0#Number of Wait States003012101110				
0	EMAF	2# F 5 F	On-Chip Code Memory Map bit Clear to map the upper 16 KB of on-chip code memory (at FF:4000h- FF:7FFFh) to the data space (at 00:C000h-00:FFFFh). Set not to map the upper 16 KB of on-chip code memory (at FF:4000 FF:7FFFh) to the data space.			FF:4000h- at FF:4000h-	

Notes: 1. The CSIZE is only available on EPROM/OTPROM products.

2. Two or four bytes are transparently popped according to INTR when using the RETI instruction. INTR must be set if interrupts are used with code executing outside region FF:.

3. Use only for Step A compatibility; set this bit when WSB1:0# are used.

Instruction Set Summary

This section contains tables that summarize the instruction set. For each instruction there is a short description, its length in bytes, and its execution time in states (one state time is equal to two system clock cycles). There are two concurrent processes limiting the effective instruction throughput:

- Instruction Fetch
- Instruction Execution

Table 20 to Table 32 assume code executing from on-chip memory, then the CPU is fetching 16-bit at a time and this is never limiting the execution speed.

If the code is fetched from external memory, a pre-fetch queue will store instructions ahead of execution to optimize the memory bandwidth usage when slower instructions are executed. However, the effective speed may be limited depending on the average size of instructions (for the considered section of the program flow). The maximum average instruction throughput is provided by Table 14 depending on the external memory configuration (from Page Mode to Non-Page Mode and the maximum number of wait states). If the average size of instructions is not an integer, the maximum effective throughput is found by pondering the number of states for the neighbor integer values.

Average size		Non-page Mode (states)					
of Instructions (bytes)	Page Mode (states)	0 Wait State	1 Wait State	2 Wait States	3 Wait States	4 Wait States	
1	1	2	3	4	5	6	
2	2	4	6	8	10	12	
3	3	6	9	12	15	18	
4	4	8	12	16	20	24	
5	5	10	15	20	25	30	

 Table 14.
 Minimum Number of States per Instruction for given Average Sizes

If the average execution time of the considered instructions is larger than the number of states given by Table 14, this larger value will prevail as the limiting factor. Otherwise, the value from Table 14 must be taken. This is providing a fair estimation of the execution speed but only the actual code execution can provide the final value.

Table 15 to Table 19 provide notation for Instruction Operands.

Notation for Instruction Operands

.

Table 15. Notation for Direct Addressing

Direct Address	Description	C251	C51
dir8	A direct 8-bit address. This can be a memory address (00h-7Fh) or a SFR address (80h-FFh). It is a byte (default), word or double word depending on the other operand.	3	3
dir16	A 16-bit memory address (00:0000h-00:FFFFh) used in direct addressing.	3	_

Notes: 1. A shaded cell denotes an instruction in the C51 Architecture.

2. In internal execution only, add 1 to the number of states if the destination/return address is internal and odd.

- 3. Add 2 to the number of states if the destination address is external.
- 4. Add 5 to the number of states if INTR = 1.

AC Characteristics - Commercial & Industrial

AC Characteristics - External Bus Cycles

Definition of Symbols

Table 38. External Bus Cycles Timing Symbol Definitions

Signals					
А	Address				
D	Data In				
L	ALE				
Q	Data Out				
R	RD#/PSEN#				
W	WR#

Н	High			
L	Low			
V	Valid			
х	No Longer Valid			
Z Floating				

Timings

Test conditions: capacitive load on all pins = 50 pF.

Table 39 and Table 40 list the AC timing parameters for the TSC80251G2D derivatives with no wait states. External wait states can be added by extending PSEN#/RD#/WR# and or by extending ALE. In these tables, Note 2 marks parameters affected by one ALE wait state, and Note 3 marks parameters affected by PSEN#/RD#/WR# wait states.

Figure 8 to Figure 13 show the bus cycles with the timing parameters.

Waveforms in Non-Page Mode Figure 8. External Bus Cycle: Code Fetch (Non-Page Mode)

Note: 1. The value of this parameter depends on wait states. See Table 39 and Table 40.

Note: 1. The value of this parameter depends on wait states. See Table 39 and Table 40.

50 AT/TSC8x251G2D

Notes: 1. Under steady-state (non-transient) conditions, I_{OL} must be externally limited as follows:

Maximum IOL per port pin: 10 mA

Maximum IOL per 8-bit port:Port 0 26 mA

Ports 1-3 15 mA

Maximum Total IOL for all: Output Pins 71 mA

If IOL exceeds the test conditions, VOL may exceed the related specification. Pins are not guaranteed to sink current greater than the listed test conditions.

- 2. Capacitive loading on Ports 0 and 2 may cause spurious noise pulses above 0.4 V on the low-level outputs of ALE and Ports 1, 2, and 3. The noise is due to external bus capacitance discharging into the Port 0 and Port 2 pins when these pins change from high to low. In applications where capacitive loading exceeds 100 pF, the noise pulses on these signals may exceed 0.8 V. It may be desirable to qualify ALE or other signals with a Schmitt Trigger or CMOS-level input logic.
- Capacitive loading on Ports 0 and 2 causes the V_{OH} on ALE and PSEN# to drop below the specification when the address lines are stabilizing.
- 4. Typical values are obtained using V_{DD} = 5 V and T_A = 25°C. They are not tested and there is not guarantee on these values.
- The input threshold voltage of SCL and SDA meets the TWI specification, so an input voltage below 0.3 V_{DD} will be recognized as a logic 0 while an input voltage above 0.7 V_{DD} will be recognized as a logic 1.

Note: 1. The clock prescaler is not used: $F_{OSC} = F_{XTAL}$.

Maximum Total IOL for all:Output Pins71 mA

If IOL exceeds the test conditions, VOL may exceed the related specification. Pins are not guaranteed to sink current greater than the listed test conditions.

- 2. Capacitive loading on Ports 0 and 2 may cause spurious noise pulses above 0.4 V on the low-level outputs of ALE and Ports 1, 2, and 3. The noise is due to external bus capacitance discharging into the Port 0 and Port 2 pins when these pins change from high to low. In applications where capacitive loading exceeds 100 pF, the noise pulses on these signals may exceed 0.8 V. It may be desirable to qualify ALE or other signals with a Schmitt Trigger or CMOS-level input logic.
- Capacitive loading on Ports 0 and 2 causes the V_{OH} on ALE and PSEN# to drop below the specification when the address lines are stabilizing.
- 4. Typical values are obtained using V_{DD} = 3 V and T_A = 25°C. They are not tested and there is not guarantee on these values.
- The input threshold voltage of SCL and SDA meets the TWI specification, so an input voltage below 0.3 V_{DD} will be recognized as a logic 0 while an input voltage above 0.7 V_{DD} will be recognized as a logic 1.

Note: 1.The clock prescaler is not used: $F_{OSC} = F_{XTAL}$.
