#### Understanding Embedded - PLDs (Programmable Logic Devices)

Embedded - PLDs, or Programmable Logic Devices, are a type of digital electronic component used to build reconfigurable digital circuits. Unlike fixed-function logic devices, PLDs can be programmed to perform specific functions by the user. This flexibility allows designers to customize the logic to meet the exact needs of their applications, making PLDs a crucial component in modern embedded systems.

#### Applications of Embedded - PLDs (Programmable Logic Devices)

The versatility of PLDs makes them suitable for a wide range of applications. In consumer electronics, PLDs are used to enhance the functionality and performance of

## Features

- Low-voltage Programmable Logic Device
  - Wide Power Supply Range - 3.0V to 5.5V
  - Ideal for Battery Powered Systems
- High-speed Operation
  - 20 ns Maximum Propagation Delay at  $V_{CC} = 3.0V$
- Commercial and Industrial Temperature Ranges
- Familiar 22V10 Logic Architecture
- Low-power 3-volt CMOS Operation

	AT22LV10L	AT22LV10
Temp	Com./Ind.	Com./Ind.
$I_{CC}$ (mA)	4/5	35/45

$V_{CC} = 3.6V$

- CMOS and TTL Compatible Inputs and Outputs
  - 10  $\mu A$  Leakage Maximum
- Reprogrammable – Tested 100% for Programmability
- High-reliability CMOS Technology
  - 2000V ESD Protection
  - 200 mA Latchup Immunity
- Dual-in-line and Surface Mount Packages

## Logic Diagram

## Description

The AT22LV10 and AT22LV10L are low-voltage compatible CMOS high-performance Programmable Logic Devices (PLDs). Speeds down to 20 ns and power dissipation as low as 14.4 mW are offered. All speed ranges are specified over the 3.0V to 5.5V range. All pins offer a low  $\pm 10 \mu A$  leakage.

The AT22LV10L provides the optimum low-power CMOS PLD solution, with low DC power (1 mA typical at  $V_{CC} = 3.3V$ ) and full CMOS output levels. The AT22LV10L significantly reduces total system power, allowing battery powered operation.

Full CMOS output levels help reduce power in many other system components.

The AT22LV10 and AT22LV10L logic architectures are identical to the familiar 22V10. Each output is allocated from eight to 16 product terms, which allows highly complex logic functions to be realized.

Two additional product terms are included to provide synchronous preset and asynchronous reset. These terms are common to all ten registers. All registers are automatically cleared upon power-up.

Register preload simplifies testing. A security fuse prevents unauthorized copying of programmed fuse patterns.

\*NOTICE: Stresses beyond those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Note: 1. Minimum voltage is -0.6V DC which may undershoot to -2.0V for pulses of less than 20 ns. Maximum pin voltage is  $V_{CC} + 0.75V$  DC which may undershoot to  $V_{CC} + 2.0V$  for pulses of less than 20 ns.

# Functional Logic Diagram AT22LV10(L)

## Preload of Registered Outputs

The registers in the AT22LV10 and AT22LV10L are provided with circuitry to allow loading of each register asynchronously with either a high or a low. This feature will simplify testing since any state can be forced into the registers to control test sequencing. A  $V_{IH}$  level on the I/O pin will force the register high; a  $V_{IL}$  will force it low, independent of the polarity bit (C0) setting. The preload state is entered by placing an 11.5V to 13V signal on pin 8 on

DIPs, and pin 10 on SMPs. When the clock pin is pulsed high, the data on the I/O pins is placed into the ten registers.

Level Forced on Registered Output Pin During Preload Cycle	Register State After Cycle
$V_{IH}$	High
$V_{IL}$	Low

## Power-up Reset

The registers in the AT22LV10 and AT22LV10L are designed to reset during power-up. At a point delayed slightly from  $V_{CC}$  crossing 2.5V, all registers will be reset to the low state. The output state will depend on the polarity of the output buffer.

This feature is critical for state machine initialization. However, due to the asynchronous nature of reset and the uncertainty of how  $V_{CC}$  actually rises in the system, the following conditions are required:

1. The  $V_{CC}$  rise must be monotonis;
2. After reset occurs, all input and feedback setup times must be met before driving the clock pin high, and
3. The clock must remain stable during  $t_{PR}$ .

Parameter	Description	Min	Typ	Max	Units
$t_{PR}$	Power-up Reset Time		600	1000	ns

## Pin Capacitance

( $f = 1 \text{ MHz}$ ,  $T = 25^\circ\text{C}$ )<sup>(1)</sup>

	Typ	Max	Units	Conditions
$C_{IN}$	5	8	pF	$V_{IN} = 0V$
$C_{OUT}$	6	8	pF	$V_{OUT} = 0V$

Note: 1. Typical values for nominal supply voltage. This parameter is only sampled and is not 100% tested.

## Erasure Characteristics

The entire fuse array of an AT22LV10 or AT22LV10L is erased after exposure to ultraviolet light at a wavelength of 2537 Å. Complete erasure is assured after a minimum of 20 minutes exposure using 12,000  $\mu\text{W}/\text{cm}^2$  intensity lamps spaced one inch away from the chip. Minimum erase time for lamps at other intensity ratings can be calculated from

the minimum integrated erasure dose of 15 W-sec/cm<sup>2</sup>. To prevent unintentional erasure, an opaque label is recommended to cover the clear window on any UV erasable PLD which will be subjected to continuous fluorescent indoor lighting or sunlight.
