

Welcome to E-XFL.COM

What is "[Embedded - Microcontrollers](#)"?

"[Embedded - Microcontrollers](#)" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "[Embedded - Microcontrollers](#)"

Details

To Our Valued Customers

We constantly strive to improve the quality of all our products and documentation. We have spent a great deal of time to ensure that these documents are correct. However, we realize that we may have missed a few things. If you find any information that is missing or appears in error, please use the reader response form in the back of this data sheet to inform us. We appreciate your assistance in making this a better document.

PIC16F8X

PIC16CXX devices contain an 8-bit ALU and working register. The ALU is a general purpose arithmetic unit. It performs arithmetic and Boolean functions between data in the working register and any register file.

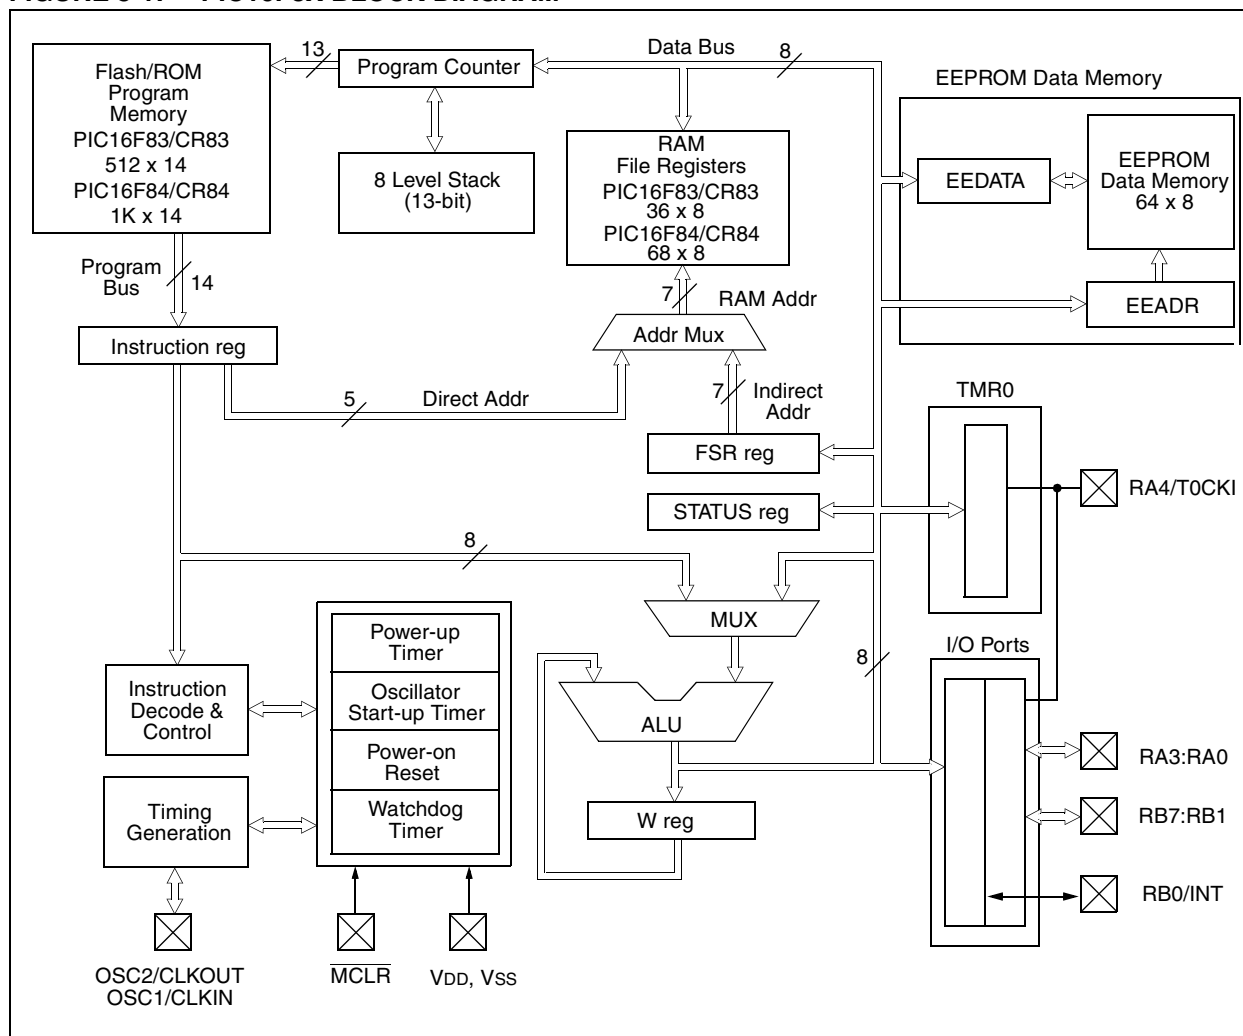

The ALU is 8-bits wide and capable of addition, subtraction, shift and logical operations. Unless otherwise mentioned, arithmetic operations are two's complement in nature. In two-operand instructions, typically one operand is the working register (W register), and the other operand is a file register or an immediate constant. In single operand instructions, the operand is either the W register or a file register.

The W register is an 8-bit working register used for ALU operations. It is not an addressable register.

Depending on the instruction executed, the ALU may affect the values of the Carry (C), Digit Carry (DC), and Zero (Z) bits in the STATUS register. The C and DC bits operate as a borrow and digit borrow out bit, respectively, in subtraction. See the `SUBLW` and `SUBWF` instructions for examples.

A simplified block diagram for the PIC16F8X is shown in Figure 3-1, its corresponding pin description is shown in Table 3-1.

FIGURE 3-1: PIC16F8X BLOCK DIAGRAM

PIC16F8X

4.2.2.2 OPTION_REG REGISTER

The OPTION_REG register is a readable and writable register which contains various control bits to configure the TMR0/WDT prescaler, the external INT interrupt, TMR0, and the weak pull-ups on PORTB.

Note: When the prescaler is assigned to the WDT (PSA = '1'), TMR0 has a 1:1 prescaler assignment.

FIGURE 4-1: OPTION_REG REGISTER (ADDRESS 81h)

| R/W-1 | R/W-1 | R/W-1 | R/W-1 | R/W-1 | R/W-1 | R/W-1 | R/W-1 |
|------------------|--------|-------|-------|-------|-------|-------|-------|
| RBP _U | INTEDG | T0CS | T0SE | PSA | PS2 | PS1 | PS0 |
| bit7 | | | | | | | bit0 |

R = Readable bit
W = Writable bit
U = Unimplemented bit, read as '0'
- n = Value at POR reset

bit 7: **RBP_U**: PORTB Pull-up Enable bit
1 = PORTB pull-ups are disabled
0 = PORTB pull-ups are enabled (by individual port latch values)

bit 6: **INTEDG**: Interrupt Edge Select bit
1 = Interrupt on rising edge of RB0/INT pin
0 = Interrupt on falling edge of RB0/INT pin

bit 5: **T0CS**: TMR0 Clock Source Select bit
1 = Transition on RA4/T0CKI pin
0 = Internal instruction cycle clock (CLKOUT)

bit 4: **T0SE**: TMR0 Source Edge Select bit
1 = Increment on high-to-low transition on RA4/T0CKI pin
0 = Increment on low-to-high transition on RA4/T0CKI pin

bit 3: **PSA**: Prescaler Assignment bit
1 = Prescaler assigned to the WDT
0 = Prescaler assigned to TMR0

bit 2-0: **PS2:PS0**: Prescaler Rate Select bits

| Bit Value | TMR0 Rate | WDT Rate |
|-----------|-----------|----------|
| 000 | 1 : 2 | 1 : 1 |
| 001 | 1 : 4 | 1 : 2 |
| 010 | 1 : 8 | 1 : 4 |
| 011 | 1 : 16 | 1 : 8 |
| 100 | 1 : 32 | 1 : 16 |
| 101 | 1 : 64 | 1 : 32 |
| 110 | 1 : 128 | 1 : 64 |
| 111 | 1 : 256 | 1 : 128 |

5.0 I/O PORTS

The PIC16F8X has two ports, PORTA and PORTB. Some port pins are multiplexed with an alternate function for other features on the device.

5.1 PORTA and TRISA Registers

PORTA is a 5-bit wide latch. RA4 is a Schmitt Trigger input and an open drain output. All other RA port pins have TTL input levels and full CMOS output drivers. All pins have data direction bits (TRIS registers) which can configure these pins as output or input.

Setting a TRISA bit (=1) will make the corresponding PORTA pin an input, i.e., put the corresponding output driver in a hi-impedance mode. Clearing a TRISA bit (=0) will make the corresponding PORTA pin an output, i.e., put the contents of the output latch on the selected pin.

Reading the PORTA register reads the status of the pins whereas writing to it will write to the port latch. All write operations are read-modify-write operations. So a write to a port implies that the port pins are first read, then this value is modified and written to the port data latch.

The RA4 pin is multiplexed with the TMR0 clock input.

FIGURE 5-1: BLOCK DIAGRAM OF PINS RA3:RA0

EXAMPLE 5-1: INITIALIZING PORTA

```
CLRF    PORTA        ; Initialize PORTA by
                      ; setting output
                      ; data latches
BSF     STATUS, RP0   ; Select Bank 1
MOVLW   0x0F          ; Value used to
                      ; initialize data
                      ; direction
MOVWF   TRISA         ; Set RA<3:0> as inputs
                      ; RA4 as outputs
                      ; TRISA<7:5> are always
                      ; read as '0'.
```

FIGURE 5-2: BLOCK DIAGRAM OF PIN RA4

PIC16F8X

EXAMPLE 5-1: INITIALIZING PORTB

```
CLRF    PORTB        ; Initialize PORTB by
                        ; setting output
                        ; data latches
BSF     STATUS, RP0   ; Select Bank 1
MOVLW   0xCF          ; Value used to
                        ; initialize data
                        ; direction
MOVWF   TRISB         ; Set RB<3:0> as inputs
                        ; RB<5:4> as outputs
                        ; RB<7:6> as inputs
```

TABLE 5-3 PORTB FUNCTIONS

| Name | Bit | Buffer Type | I/O Consistency Function |
|---------|------|-----------------------|---|
| RB0/INT | bit0 | TTL/ST ⁽¹⁾ | Input/output pin or external interrupt input. Internal software programmable weak pull-up. |
| RB1 | bit1 | TTL | Input/output pin. Internal software programmable weak pull-up. |
| RB2 | bit2 | TTL | Input/output pin. Internal software programmable weak pull-up. |
| RB3 | bit3 | TTL | Input/output pin. Internal software programmable weak pull-up. |
| RB4 | bit4 | TTL | Input/output pin (with interrupt on change). Internal software programmable weak pull-up. |
| RB5 | bit5 | TTL | Input/output pin (with interrupt on change). Internal software programmable weak pull-up. |
| RB6 | bit6 | TTL/ST ⁽²⁾ | Input/output pin (with interrupt on change). Internal software programmable weak pull-up. Serial programming clock. |
| RB7 | bit7 | TTL/ST ⁽²⁾ | Input/output pin (with interrupt on change). Internal software programmable weak pull-up. Serial programming data. |

Legend: TTL = TTL input, ST = Schmitt Trigger.

Note 1: This buffer is a Schmitt Trigger input when configured as the external interrupt.

2: This buffer is a Schmitt Trigger input when used in serial programming mode.

TABLE 5-4 SUMMARY OF REGISTERS ASSOCIATED WITH PORTB

| Address | Name | Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 | Value on Power-on Reset | Value on all other resets |
|---------|------------|------------------|--------|--------|--------|--------|--------|--------|---------|-------------------------|---------------------------|
| 06h | PORTB | RB7 | RB6 | RB5 | RB4 | RB3 | RB2 | RB1 | RB0/INT | xxxx xxxx | uuuu uuuu |
| 86h | TRISB | TRISB7 | TRISB6 | TRISB5 | TRISB4 | TRISB3 | TRISB2 | TRISB1 | TRISB0 | 1111 1111 | 1111 1111 |
| 81h | OPTION_REG | RBP _U | INTEDG | T0CS | T0SE | PSA | PS2 | PS1 | PS0 | 1111 1111 | 1111 1111 |

Legend: x = unknown, u = unchanged. Shaded cells are not used by PORTB.

8.9 Interrupts

The PIC16F8X has 4 sources of interrupt:

- External interrupt RB0/INT pin
- TMR0 overflow interrupt
- PORTB change interrupts (pins RB7:RB4)
- Data EEPROM write complete interrupt

The interrupt control register (INTCON) records individual interrupt requests in flag bits. It also contains the individual and global interrupt enable bits.

The global interrupt enable bit, GIE (INTCON<7>) enables (if set) all un-masked interrupts or disables (if cleared) all interrupts. Individual interrupts can be disabled through their corresponding enable bits in INTCON register. Bit GIE is cleared on reset.

The “return from interrupt” instruction, RETFIE, exits interrupt routine as well as sets the GIE bit, which re-enable interrupts.

The RB0/INT pin interrupt, the RB port change interrupt and the TMR0 overflow interrupt flags are contained in the INTCON register.

When an interrupt is responded to; the GIE bit is cleared to disable any further interrupt, the return address is pushed onto the stack and the PC is loaded with 0004h. For external interrupt events, such as the RB0/INT pin or PORTB change interrupt, the interrupt latency will be three to four instruction cycles. The exact latency depends when the interrupt event occurs (Figure 8-17). The latency is the same for both one and two cycle instructions. Once in the interrupt service routine the source(s) of the interrupt can be determined by polling the interrupt flag bits. The interrupt flag bit(s) must be cleared in software before re-enabling interrupts to avoid infinite interrupt requests.

Note 1: Individual interrupt flag bits are set regardless of the status of their corresponding mask bit or the GIE bit.

FIGURE 8-16: INTERRUPT LOGIC

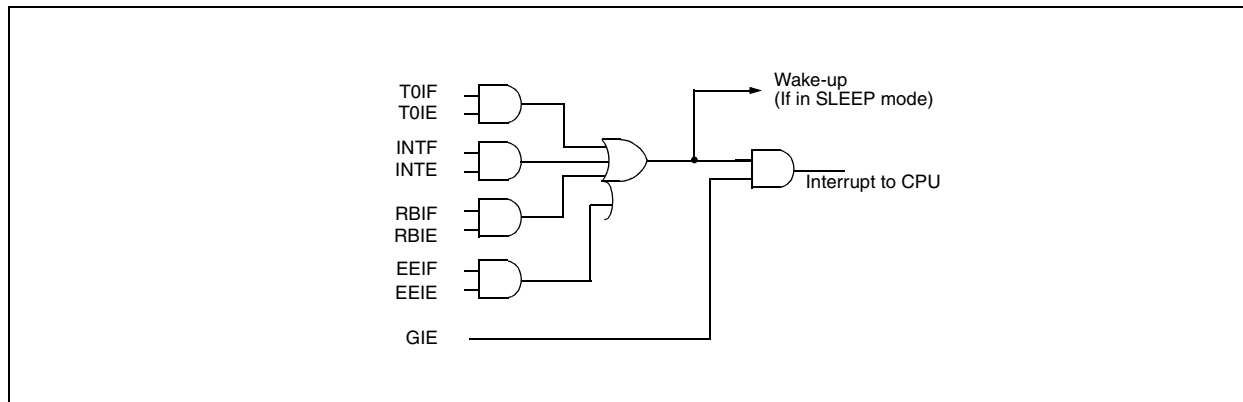

FIGURE 8-17: INT PIN INTERRUPT TIMING

8.9.1 INT INTERRUPT

External interrupt on RB0/INT pin is edge triggered: either rising if INTEDG bit (OPTION_REG<6>) is set, or falling, if INTEDG bit is clear. When a valid edge appears on the RB0/INT pin, the INTF bit (INTCON<1>) is set. This interrupt can be disabled by clearing control bit INTE (INTCON<4>). Flag bit INTF must be cleared in software via the interrupt service routine before re-enabling this interrupt. The INT interrupt can wake the processor from SLEEP (Section 8.12) only if the INTE bit was set prior to going into SLEEP. The status of the GIE bit decides whether the processor branches to the interrupt vector following wake-up.

8.9.2 TMR0 INTERRUPT

An overflow (FFh → 00h) in TMR0 will set flag bit T0IF (INTCON<2>). The interrupt can be enabled/disabled by setting/clearing enable bit T0IE (INTCON<5>) (Section 6.0).

8.9.3 PORT RB INTERRUPT

An input change on PORTB<7:4> sets flag bit RBIF (INTCON<0>). The interrupt can be enabled/disabled by setting/clearing enable bit RBIE (INTCON<3>) (Section 5.2).

Note 1: For a change on the I/O pin to be recognized, the pulse width must be at least Tcy wide.

8.12.3 WAKE-UP USING INTERRUPTS

When global interrupts are disabled (GIE cleared) and any interrupt source has both its interrupt enable bit and interrupt flag bit set, one of the following will occur:

- If the interrupt occurs **before** the execution of a **SLEEP** instruction, the **SLEEP** instruction will complete as a NOP. Therefore, the WDT and WDT postscaler will not be cleared, the $\overline{\text{TO}}$ bit will not be set and $\overline{\text{PD}}$ bits will not be cleared.
- If the interrupt occurs **during or after** the execution of a **SLEEP** instruction, the device will immediately wake up from sleep. The **SLEEP** instruction will be completely executed before the wake-up. Therefore, the WDT and WDT postscaler will be cleared, the $\overline{\text{TO}}$ bit will be set and the $\overline{\text{PD}}$ bit will be cleared.

Even if the flag bits were checked before executing a **SLEEP** instruction, it may be possible for flag bits to become set before the **SLEEP** instruction completes. To determine whether a **SLEEP** instruction executed, test the $\overline{\text{PD}}$ bit. If the $\overline{\text{PD}}$ bit is set, the **SLEEP** instruction was executed as a NOP.

To ensure that the WDT is cleared, a **CLRWDT** instruction should be executed before a **SLEEP** instruction.

8.13 Program Verification/Code Protection

If the code protection bit(s) have not been programmed, the on-chip program memory can be read out for verification purposes.

Note: Microchip does not recommend code protecting widowed devices.

8.14 ID Locations

Four memory locations (2000h - 2003h) are designated as ID locations to store checksum or other code identification numbers. These locations are not accessible during normal execution but are readable and writable only during program/verify. Only the 4 least significant bits of ID location are usable.

For ROM devices, these values are submitted along with the ROM code.

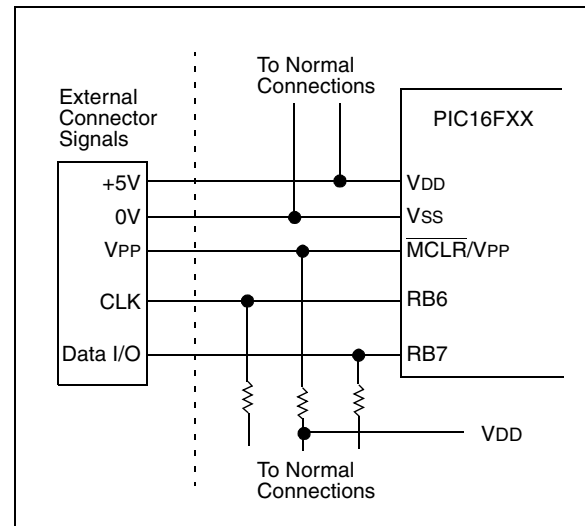

8.15 In-Circuit Serial Programming

PIC16F8X microcontrollers can be serially programmed while in the end application circuit. This is simply done with two lines for clock and data, and three other lines for power, ground, and the programming voltage. Customers can manufacture boards with unprogrammed devices, and then program the microcontroller just before shipping the product, allowing the most recent firmware or custom firmware to be programmed.

The device is placed into a program/verify mode by holding the RB6 and RB7 pins low, while raising the $\overline{\text{MCLR}}$ pin from V_{IL} to V_{IH} (see programming specification). RB6 becomes the programming clock and RB7 becomes the programming data. Both RB6 and RB7 are Schmitt Trigger inputs in this mode.

After reset, to place the device into programming/verify mode, the program counter (PC) points to location 00h. A 6-bit command is then supplied to the device, 14-bits of program data is then supplied to or from the device, using load or read-type instructions. For complete details of serial programming, please refer to the PIC16CXX Programming Specifications (Literature #DS30189).

FIGURE 8-20: TYPICAL IN-SYSTEM SERIAL PROGRAMMING CONNECTION

For ROM devices, both the program memory and Data EEPROM memory may be read, but only the Data EEPROM memory may be programmed.

PIC16F8X

| BCF | | Bit Clear f | | | | | | |
|-------------------|--|-------------------|--------------|--------------------|----|------|------|------|
| Syntax: | [label] BCF f,b | | | | | | | |
| Operands: | $0 \leq f \leq 127$ $0 \leq b \leq 7$ | | | | | | | |
| Operation: | $0 \rightarrow (f)$ | | | | | | | |
| Status Affected: | None | | | | | | | |
| Encoding: | <table><tr><td>01</td><td>00bb</td><td>bfff</td><td>ffff</td></tr></table> | | | | 01 | 00bb | bfff | ffff |
| 01 | 00bb | bfff | ffff | | | | | |
| Description: | Bit 'b' in register 'f' is cleared. | | | | | | | |
| Words: | 1 | | | | | | | |
| Cycles: | 1 | | | | | | | |
| Q Cycle Activity: | Q1 | Q2 | Q3 | Q4 | | | | |
| | Decode | Read register 'f' | Process data | Write register 'f' | | | | |

Example

```

BCF    FLAG_REG, 7

Before Instruction
FLAG_REG = 0xC7
After Instruction
FLAG_REG = 0x47

```

| BSF | | Bit Set f | | | |
|-------------------|--|-------------------|--------------|--------------------|--|
| Syntax: | [label] BSF f,b | | | | |
| Operands: | $0 \leq f \leq 127$ $0 \leq b \leq 7$ | | | | |
| Operation: | $1 \rightarrow (f < b)$ | | | | |
| Status Affected: | None | | | | |
| Encoding: | 01 | 01bb | bfff | ffff | |
| Description: | Bit 'b' in register 'f' is set. | | | | |
| Words: | 1 | | | | |
| Cycles: | 1 | | | | |
| Q Cycle Activity: | Q1 | Q2 | Q3 | Q4 | |
| | Decode | Read register 'f' | Process data | Write register 'f' | |

Example

```

BSF    FLAG_REG, 7

Before Instruction
FLAG_REG = 0x0A
After Instruction
FLAG_REG = 0x8A

```

| BTFSC | | Bit Test, Skip if Clear | | | | | | |
|-------------------|--|-------------------------|------|----|----|------|------|------|
| Syntax: | [label] BTFSC f,b | | | | | | | |
| Operands: | $0 \leq f \leq 127$ $0 \leq b \leq 7$ | | | | | | | |
| Operation: | skip if $(f < b) = 0$ | | | | | | | |
| Status Affected: | None | | | | | | | |
| Encoding: | <table><tr><td>01</td><td>10bb</td><td>bfff</td><td>ffff</td></tr></table> | | | | 01 | 10bb | bfff | ffff |
| 01 | 10bb | bfff | ffff | | | | | |
| Description: | If bit 'b' in register 'f' is '1' then the next instruction is executed. If bit 'b', in register 'f', is '0' then the next instruction is discarded, and a NOP is executed instead, making this a 2TCY instruction. | | | | | | | |
| Words: | 1 | | | | | | | |
| Cycles: | 1(2) | | | | | | | |
| Q Cycle Activity: | Q1 | Q2 | Q3 | Q4 | | | | |

If Skip: (2nd Cycle)

| Q1 | Q2 | Q3 | Q4 |
|--------------|--------------|--------------|--------------|
| No-Operation | No-Operation | No-Operation | No-Operation |

Example

```

HERE    BTFSC  FLAG, 1
FALSE   GOTO   PROCESS_CODE
TRUE    :
        :
        :

```

Before Instruction
PC = address HERE

After Instruction
if $FLAG<1> = 0$,
PC = address TRUE
if $FLAG<1> \geq 1$,
PC = address FALSE

| NOP | | No Operation | | | |
|-------------------|----------------------|--------------|--------------|--------------|--|
| Syntax: | [<i>label</i>] NOP | | | | |
| Operands: | None | | | | |
| Operation: | No operation | | | | |
| Status Affected: | None | | | | |
| Encoding: | 00 | 0000 | 0xx0 | 0000 | |
| Description: | No operation. | | | | |
| Words: | 1 | | | | |
| Cycles: | 1 | | | | |
| Q Cycle Activity: | Q1 | Q2 | Q3 | Q4 | |
| | Decode | No-Operation | No-Operation | No-Operation | |
| Example | NOP | | | | |

| RETfIE | | Return from Interrupt | | | | | |
|-------------------|--|-----------------------|--|--|--------------|-----------------|--------------------|
| Syntax: | [<i>label</i>] RETfIE | | | | | | |
| Operands: | None | | | | | | |
| Operation: | TOS → PC, 1 → GIE | | | | | | |
| Status Affected: | None | | | | | | |
| Encoding: | 00 | | | | 0000 | 0000 | 1001 |
| Description: | Return from Interrupt. Stack is POPed and Top of Stack (TOS) is loaded in the PC. Interrupts are enabled by setting Global Interrupt Enable bit, GIE (INTCON<7>). This is a two cycle instruction. | | | | | | |
| Words: | 1 | | | | | | |
| Cycles: | 2 | | | | | | |
| Q Cycle Activity: | Q1 | | | | Q2 | Q3 | Q4 |
| 1st Cycle | Decode | | | | No-Operation | Set the GIE bit | Pop from the Stack |
| 2nd Cycle | No-Operation | | | | No-Operation | No-Operation | No-Operation |
| Example | RETfIE | | | | | | |

| OPTION | Load Option Register | | | |
|------------------|--|------|------|------|
| Syntax: | [<i>label</i>] OPTION | | | |
| Operands: | None | | | |
| Operation: | (W) → OPTION | | | |
| Status Affected: | None | | | |
| Encoding: | 00 | 0000 | 0110 | 0010 |
| Description: | The contents of the W register are loaded in the OPTION register. This instruction is supported for code compatibility with PIC16C5X products. Since OPTION is a readable/writable register, the user can directly address it. | | | |
| Words: | 1 | | | |
| Cycles: | 1 | | | |
| Example | | | | |
| | To maintain upward compatibility with future PIC16CXX products, do not use this instruction. | | | |

PIC16F8X

XORLW Exclusive OR Literal with W

Syntax: `[label] XORLW k`

Operands: $0 \leq k \leq 255$

Operation: $(W) \text{ .XOR. } k \rightarrow (W)$

Status Affected: Z

Encoding:

| | | | |
|----|------|------|------|
| 11 | 1010 | kkkk | kkkk |
|----|------|------|------|

Description: The contents of the W register are XOR'ed with the eight bit literal 'k'. The result is placed in the W register.

Words: 1

Cycles: 1

Q Cycle Activity:

| Q1 | Q2 | Q3 | Q4 |
|--------|------------------|--------------|------------|
| Decode | Read literal 'k' | Process data | Write to W |

Example: `XORLW 0xAF`

Before Instruction

W = 0xB5

After Instruction

W = 0x1A

XORWF Exclusive OR W with f

Syntax: `[label] XORWF f,d`

Operands: $0 \leq f \leq 127$
 $d \in [0,1]$

Operation: $(W) \text{ .XOR. } (f) \rightarrow (\text{destination})$

Status Affected: Z

Encoding:

| | | | |
|----|------|------|------|
| 00 | 0110 | dfff | ffff |
|----|------|------|------|

Description: Exclusive OR the contents of the W register with register 'f'. If 'd' is 0 the result is stored in the W register. If 'd' is 1 the result is stored back in register 'f'.

Words: 1

Cycles: 1

Q Cycle Activity:

| Q1 | Q2 | Q3 | Q4 |
|--------|-------------------|--------------|----------------------|
| Decode | Read register 'f' | Process data | Write to destination |

Example `XORWF REG 1`

Before Instruction

REG = 0xAF

W = 0xB5

After Instruction

REG = 0x1A

W = 0xB5

MPASM has the following features to assist in developing software for specific use applications.

- Provides translation of Assembler source code to object code for all Microchip microcontrollers.
- Macro assembly capability.
- Produces all the files (Object, Listing, Symbol, and special) required for symbolic debug with Microchip's emulator systems.
- Supports Hex (default), Decimal and Octal source and listing formats.

MPASM provides a rich directive language to support programming of the PIC MCU. Directives are helpful in making the development of your assemble source code shorter and more maintainable.

10.11 **Software Simulator (MPLAB-SIM)**

The MPLAB-SIM Software Simulator allows code development in a PC host environment. It allows the user to simulate the PIC MCU series microcontrollers on an instruction level. On any given instruction, the user may examine or modify any of the data areas or provide external stimulus to any of the pins. The input/output radix can be set by the user and the execution can be performed in; single step, execute until break, or in a trace mode.

MPLAB-SIM fully supports symbolic debugging using MPLAB-C and MPASM. The Software Simulator offers the low cost flexibility to develop and debug code outside of the laboratory environment making it an excellent multi-project software development tool.

10.12 **C Compiler (MPLAB-C17)**

The MPLAB-C Code Development System is a complete 'C' compiler and integrated development environment for Microchip's PIC17CXXX family of microcontrollers. The compiler provides powerful integration capabilities and ease of use not found with other compilers.

For easier source level debugging, the compiler provides symbol information that is compatible with the MPLAB IDE memory display.

10.13 **Fuzzy Logic Development System (fuzzyTECH-MP)**

fuzzyTECH-MP fuzzy logic development tool is available in two versions - a low cost introductory version, MP Explorer, for designers to gain a comprehensive working knowledge of fuzzy logic system design; and a full-featured version, *fuzzyTECH-MP*, Edition for implementing more complex systems.

Both versions include Microchip's *fuzzyLAB™* demonstration board for hands-on experience with fuzzy logic systems implementation.

10.14 **MP-DriveWay™ – Application Code Generator**

MP-DriveWay is an easy-to-use Windows-based Application Code Generator. With MP-DriveWay you can visually configure all the peripherals in a PIC device and, with a click of the mouse, generate all the initialization and many functional code modules in C language. The output is fully compatible with Microchip's MPLAB-C C compiler. The code produced is highly modular and allows easy integration of your own code. MP-DriveWay is intelligent enough to maintain your code through subsequent code generation.

10.15 **SEEVAL® Evaluation and Programming System**

The SEEVAL SEEPROM Designer's Kit supports all Microchip 2-wire and 3-wire Serial EEPROMs. The kit includes everything necessary to read, write, erase or program special features of any Microchip SEEPROM product including Smart Serials™ and secure serials. The Total Endurance™ Disk is included to aid in trade-off analysis and reliability calculations. The total kit can significantly reduce time-to-market and result in an optimized system.

10.16 **KEELOQ® Evaluation and Programming Tools**

KEELOQ evaluation and programming tools support Microchips HCS Secure Data Products. The HCS evaluation kit includes an LCD display to show changing codes, a decoder to decode transmissions, and a programming interface to program test transmitters.

10.3 DC CHARACTERISTICS:

PIC16F84, PIC16F83 (Commercial, Industrial)
 PIC16LF84, PIC16LF83 (Commercial, Industrial)

| DC Characteristics All Pins Except Power Supply Pins | | Standard Operating Conditions (unless otherwise stated) Operating temperature $0^{\circ}\text{C} \leq T_A \leq +70^{\circ}\text{C}$ (commercial) $-40^{\circ}\text{C} \leq T_A \leq +85^{\circ}\text{C}$ (industrial) Operating voltage V_{DD} range as described in DC spec Section 10.1 and Section 10.2. | | | | | |
|--|-----------|---|---|----------------------------|--|---|---|
| Parameter No. | Sym | Characteristic | Min | Typ† | Max | Units | Conditions |
| D030 D030A D031 D032 D033 D034 | V_{IL} | Input Low Voltage I/O ports with TTL buffer with Schmitt Trigger buffer $\overline{\text{MCLR}}$, RA4/T0CKI OSC1 (XT, HS and LP modes) ⁽¹⁾ OSC1 (RC mode) | V_{SS} V_{SS} V_{SS} V_{SS} V_{SS} V_{SS} | — — — — — — | 0.8 0.16 V_{DD} 0.2 V_{DD} 0.2 V_{DD} 0.3 V_{DD} 0.1 V_{DD} | V V V V V V | $4.5\text{ V} \leq V_{DD} \leq 5.5\text{ V}^{(4)}$ entire range ⁽⁴⁾ entire range |
| D040 D040A D041 D042 D043 | V_{IH} | Input High Voltage I/O ports with TTL buffer with Schmitt Trigger buffer $\overline{\text{MCLR}}$, RA4/T0CKI, OSC1 (RC mode) OSC1 (XT, HS and LP modes) ⁽¹⁾ | 2.4 0.48 V_{DD} 0.45 V_{DD} 0.85 V_{DD} 0.7 V_{DD} | — — — — — | V_{DD} V_{DD} V_{DD} V_{DD} V_{DD} | V V V V V | $4.5\text{ V} \leq V_{DD} \leq 5.5\text{ V}^{(4)}$ entire range ⁽⁴⁾ entire range |
| D050 | V_{HYS} | Hysteresis of Schmitt Trigger inputs | TBD | — | — | V | |
| D070 | IPURB | PORTB weak pull-up current | 50* | 250* | 400* | μA | $V_{DD} = 5.0\text{V}$, $V_{PIN} = V_{SS}$ |
| D060 D061 D063 | I_{IL} | Input Leakage Current ^(2,3) I/O ports $\overline{\text{MCLR}}$, RA4/T0CKI OSC1 | — — — | — — — | ± 1 ± 5 ± 5 | μA μA μA | $V_{SS} \leq V_{PIN} \leq V_{DD}$, Pin at hi-impedance $V_{SS} \leq V_{PIN} \leq V_{DD}$ $V_{SS} \leq V_{PIN} \leq V_{DD}$, XT, HS and LP osc configuration |
| D080 D083 | V_{OL} | Output Low Voltage I/O ports OSC2/CLKOUT | — — | — — | 0.6 0.6 | V V | $I_{OL} = 8.5\text{ mA}$, $V_{DD} = 4.5\text{V}$ $I_{OL} = 1.6\text{ mA}$, $V_{DD} = 4.5\text{V}$ |
| D090 D092 | V_{OH} | Output High Voltage I/O ports ⁽³⁾ OSC2/CLKOUT | $V_{DD}-0.7$ $V_{DD}-0.7$ | — — | — — | V V | $I_{OH} = -3.0\text{ mA}$, $V_{DD} = 4.5\text{V}$ $I_{OH} = -1.3\text{ mA}$, $V_{DD} = 4.5\text{V}$ |

* These parameters are characterized but not tested.

† Data in "Typ" column is at 5.0V, 25°C unless otherwise stated. These parameters are for design guidance only and are not tested.

Note 1: In RC oscillator configuration, the OSC1 pin is a Schmitt Trigger input. Do not drive the PIC16F8X with an external clock while the device is in RC mode, or chip damage may result.

2: The leakage current on the $\overline{\text{MCLR}}$ pin is strongly dependent on the applied voltage level. The specified levels represent normal operating conditions. Higher leakage current may be measured at different input voltages.

3: Negative current is defined as coming out of the pin.

4: The user may choose the better of the two specs.

**11.3 DC CHARACTERISTICS: PIC16CR84, PIC16CR83 (Commercial, Industrial)
PIC16LCR84, PIC16LCR83 (Commercial, Industrial)**

| DC Characteristics All Pins Except Power Supply Pins | | Standard Operating Conditions (unless otherwise stated) Operating temperature $0^{\circ}\text{C} \leq T_A \leq +70^{\circ}\text{C}$ (commercial) $-40^{\circ}\text{C} \leq T_A \leq +85^{\circ}\text{C}$ (industrial) Operating voltage V_{DD} range as described in DC spec Section 11.1 and Section 11.2. | | | | | |

12.0 DC & AC CHARACTERISTICS GRAPHS/TABLES

The graphs and tables provided in this section are for **design guidance** and are **not tested or guaranteed**.

In some graphs or tables, the data presented are **outside specified operating range** (i.e., outside specified V_{DD} range). This is for **information only** and devices are guaranteed to operate properly only within the specified range.

The data presented in this section is a **statistical summary** of data collected on units from different lots over a period of time and matrix samples. 'Typical' represents the mean of the distribution at 25°C, while 'max' or 'min' represents (mean + 3 σ) and (mean - 3 σ) respectively, where σ is standard deviation.

FIGURE 12-1: TYPICAL RC OSCILLATOR FREQUENCY vs. TEMPERATURE

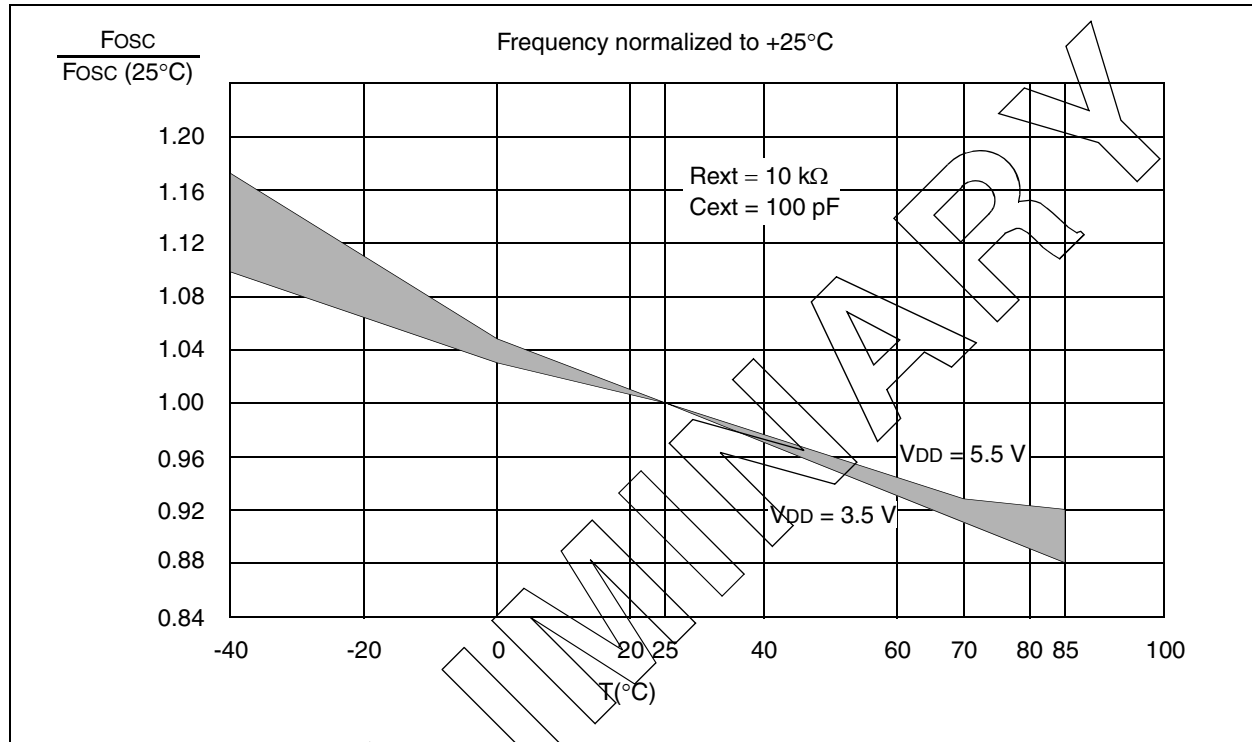

TABLE 12-1 RC OSCILLATOR FREQUENCIES*

| Cext | Rext | Average Fosc @ 5V, 25°C | |
|--------|-------|----------------------------|------------------------|
| | | | Part to Part Variation |
| 20 pF | 5 k | 4.61 MHz | ± 25% |
| | 10 k | 2.66 MHz | ± 24% |
| | 100 k | 311 kHz | ± 39% |
| 100 pF | 5 k | 1.34 MHz | ± 21% |
| | 10 k | 756 kHz | ± 18% |
| | 100 k | 82.8 kHz | ± 28% |
| 300 pF | 5 k | 428 kHz | ± 13% |
| | 10 k | 243 kHz | ± 13% |
| | 100 k | 26.2 kHz | ± 23% |

* Measured on DIP packages. The percentage variation indicated here is part-to-part variation due to normal process distribution. The variation indicated is ± 3 standard deviation from average value for full V_{DD} range.

Questions:

1. What are the best features of this document?

2. How does this document meet your hardware and software development needs?

3. Do you find the organization of this data sheet easy to follow? If not, why?

4. What additions to the data sheet do you think would enhance the structure and subject?

5. What deletions from the data sheet could be made without affecting the overall usefulness?

6. Is there any incorrect or misleading information (what and where)?

7. How would you improve this document?

8. How would you improve our software, systems, and silicon products?
