
Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Active
Core Processor	XCore
Core Size	32-Bit 8-Core
Speed	1000MIPS
Connectivity	USB
Peripherals	-
Number of I/O	33
Program Memory Size	-
Program Memory Type	ROMless
EEPROM Size	-
RAM Size	128K x 8
Voltage - Supply (Vcc/Vdd)	0.95V ~ 3.6V
Data Converters	-
Oscillator Type	External
Operating Temperature	-40°C ~ 85°C (TA)
Mounting Type	Surface Mount
Package / Case	64-TQFP Exposed Pad
Supplier Device Package	64-TQFP (10x10)
Purchase URL	https://www.e-xfl.com/product-detail/xmos/xu208-128-tq64-i10

- **Ports** The I/O pins are connected to the processing cores by Hardware Response ports. The port logic can drive its pins high and low, or it can sample the value on its pins optionally waiting for a particular condition. Section 6.3
- **Clock blocks** xCORE devices include a set of programmable clock blocks that can be used to govern the rate at which ports execute. Section 6.4
- **Memory** Each xCORE Tile integrates a bank of SRAM for instructions and data, and a block of one-time programmable (OTP) memory that can be configured for system wide security features. Section 9
- **PLL** The PLL is used to create a high-speed processor clock given a low speed external oscillator. Section 7
- **USB** The USB PHY provides High-Speed and Full-Speed, device, host, and on-the-go functionality. Data is communicated through ports on the digital node. A library is provided to implement USB device functionality. Section 10
- **JTAG** The JTAG module can be used for loading programs, boundary scan testing, in-circuit source-level debugging and programming the OTP memory. Section 11

1.1 Software

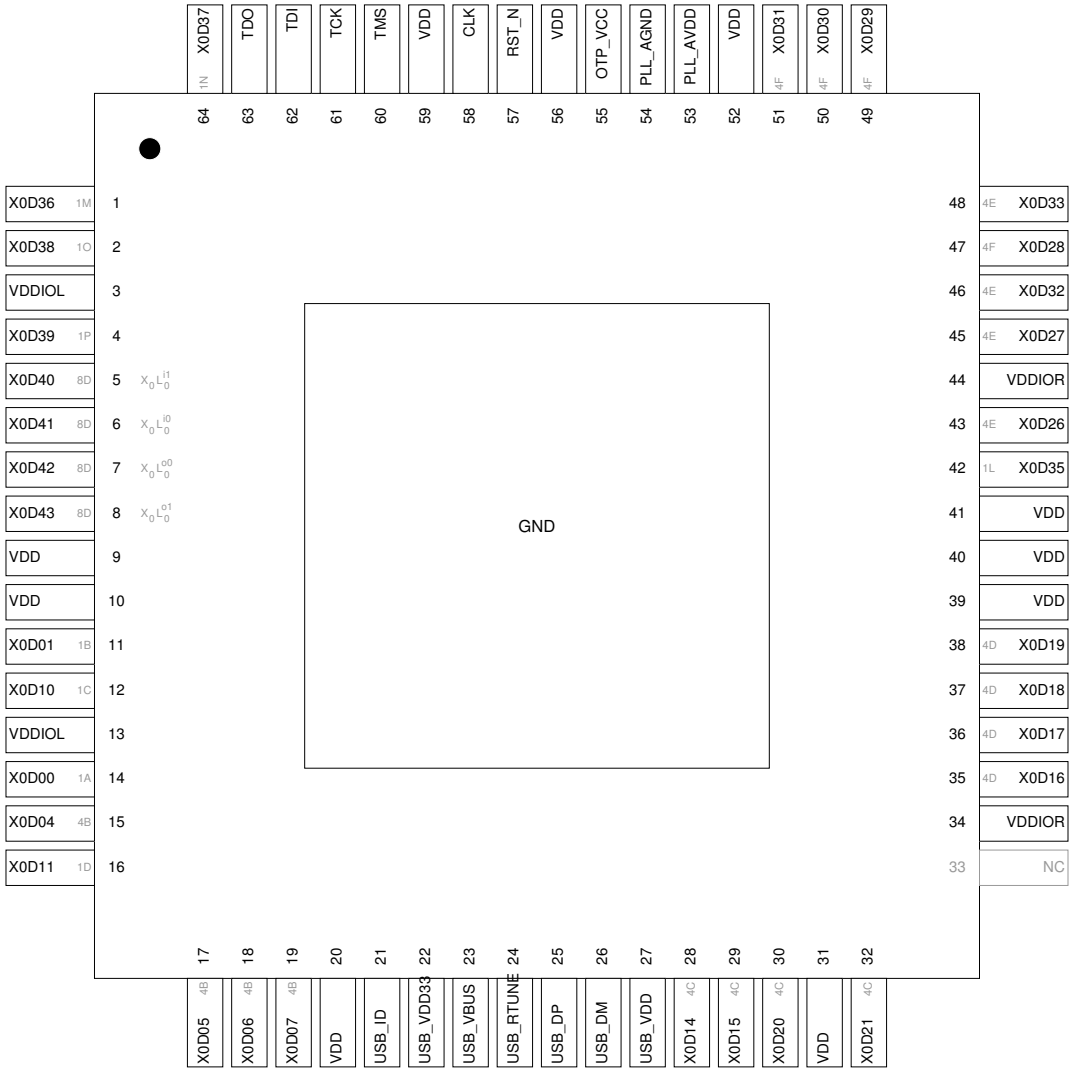
Devices are programmed using C, C++ or xC (C with multicore extensions). XMOS provides tested and proven software libraries, which allow you to quickly add interface and processor functionality such as USB, Ethernet, PWM, graphics driver, and audio EQ to your applications.

1.2 xTIMEcomposer Studio

The xTIMEcomposer Studio development environment provides all the tools you need to write and debug your programs, profile your application, and write images into flash memory or OTP memory on the device. Because xCORE devices operate deterministically, they can be simulated like hardware within xTIMEcomposer: uniquely in the embedded world, xTIMEcomposer Studio therefore includes a static timing analyzer, cycle-accurate simulator, and high-speed in-circuit instrumentation.

xTIMEcomposer can be driven from either a graphical development environment, or the command line. The tools are supported on Windows, Linux and MacOS X and available at no cost from xmos.com/downloads. Information on using the tools is provided in the xTIMEcomposer User Guide, X3766.

3 Pin Configuration



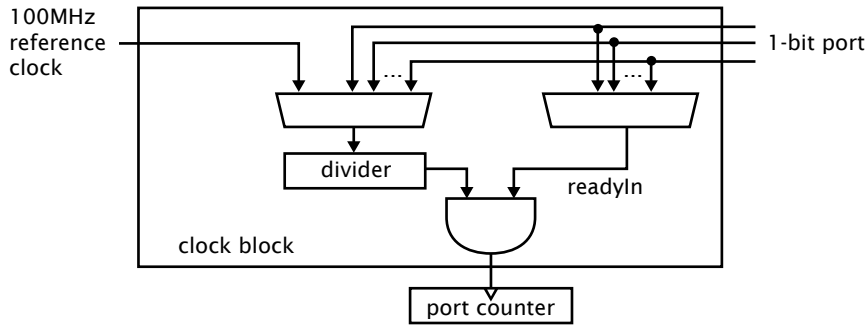


Figure 5: Clock block diagram

A clock block can use a 1-bit port as its clock source allowing external application clocks to be used to drive the input and output interfaces. xCORE-200 clock blocks optionally divide the clock input from a 1-bit port.

In many cases I/O signals are accompanied by strobing signals. The xCORE ports can input and interpret strobe (known as readyIn and readyOut) signals generated by external sources, and ports can generate strobe signals to accompany output data.

On reset, each port is connected to clock block 0, which runs from the xCORE Tile reference clock.

6.5 Channels and Channel Ends

Logical cores communicate using point-to-point connections, formed between two channel ends. A channel-end is a resource on an xCORE tile, that is allocated by the program. Each channel-end has a unique system-wide identifier that comprises a unique number and their tile identifier. Data is transmitted to a channel-end by an output-instruction; and the other side executes an input-instruction. Data can be passed synchronously or asynchronously between the channel ends.

6.6 xCONNECT Switch and Links

XMOS devices provide a scalable architecture, where multiple xCORE devices can be connected together to form one system. Each xCORE device has an xCONNECT interconnect that provides a communication infrastructure for all tasks that run on the various xCORE tiles on the system.

The interconnect relies on a collection of switches and XMOS links. Each xCORE device has an on-chip switch that can set up circuits or route data. The switches are connected by xConnect Links. An XMOS link provides a physical connection between two switches. The switch has a routing algorithm that supports many different topologies, including lines, meshes, trees, and hypercubes.

The links operate in either 2 wires per direction or 5 wires per direction mode, depending on the amount of bandwidth required. Circuit switched, streaming

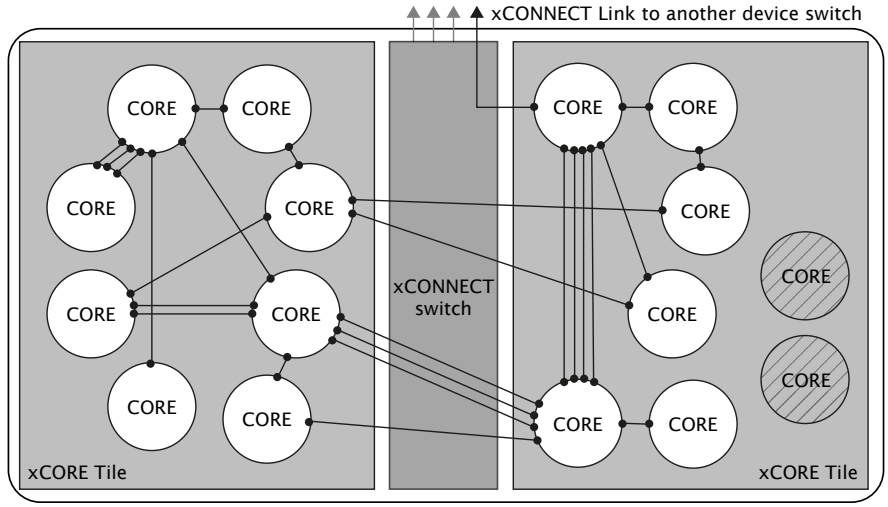

Figure 6: Switch, links and channel ends

and packet switched data can both be supported efficiently. Streams provide the fastest possible data rates between xCORE Tiles (up to 250 MBit/s), but each stream requires a single link to be reserved between switches on two tiles. All packet communications can be multiplexed onto a single link.

Information on the supported routing topologies that can be used to connect multiple devices together can be found in the XS1-U Link Performance and Design Guide, X2999.

7 PLL

The PLL creates a high-speed clock that is used for the switch, tile, and reference clock. The initial PLL multiplication value is shown in Figure 7:

Figure 7: The initial PLL multiplier values

Oscillator Frequency	Tile Boot Frequency	PLL Ratio	PLL settings		
			OD	F	R
9-25 MHz	144-400 MHz	16	1	63	0

Figure 7 also lists the values of OD, F and R, which are the registers that define the ratio of the tile frequency to the oscillator frequency:

$$F_{core} = F_{osc} \times \frac{F+1}{2} \times \frac{1}{R+1} \times \frac{1}{OD+1}$$

OD, F and R must be chosen so that $0 \leq R \leq 63$, $0 \leq F \leq 4095$, $0 \leq OD \leq 7$, and $260MHz \leq F_{osc} \times \frac{F+1}{2} \times \frac{1}{R+1} \leq 1.3GHz$. The OD, F, and R values can be modified by writing to the digital node PLL configuration register.

8.5 Boot from OTP

If an xCORE tile is set to use secure boot (see Figure 8), the boot image is read from address 0 of the OTP memory in the tile's security module.

This feature can be used to implement a secure bootloader which loads an encrypted image from external flash, decrypts and CRC checks it with the processor, and discontinues the boot process if the decryption or CRC check fails. XMOS provides a default secure bootloader that can be written to the OTP along with secret decryption keys.

Each tile has its own individual OTP memory, and hence some tiles can be booted from OTP while others are booted from SPI or the channel interface. This enables systems to be partially programmed, dedicating one or more tiles to perform a particular function, leaving the other tiles user-programmable.

8.6 Security register

The security register enables security features on the xCORE tile. The features shown in Figure 13 provide a strong level of protection and are sufficient for providing strong IP security.

Feature	Bit	Description
Disable JTAG	0	The JTAG interface is disabled, making it impossible for the tile state or memory content to be accessed via the JTAG interface.
Disable Link access	1	Other tiles are forbidden access to the processor state via the system switch. Disabling both JTAG and Link access transforms an xCORE Tile into a "secure island" with other tiles free for non-secure user application code.
Secure Boot	5	The xCORE Tile is forced to boot from address 0 of the OTP, allowing the xCORE Tile boot ROM to be bypassed (*see* §8).
Redundant rows	7	Enables redundant rows in OTP.
Sector Lock 0	8	Disable programming of OTP sector 0.
Sector Lock 1	9	Disable programming of OTP sector 1.
Sector Lock 2	10	Disable programming of OTP sector 2.
Sector Lock 3	11	Disable programming of OTP sector 3.
OTP Master Lock	12	Disable OTP programming completely: disables updates to all sectors and security register.
Disable JTAG-OTP	13	Disable all (read & write) access from the JTAG interface to this OTP.
	21..15	General purpose software accessable security register available to end-users.
	31..22	General purpose user programmable JTAG UserID code extension.

Figure 13: Security register features

9 Memory

9.1 OTP

The xCORE Tile integrates 8 KB one-time programmable (OTP) memory along with a security register that configures system wide security features. The OTP holds data in four sectors each containing 512 rows of 32 bits which can be used to implement secure bootloaders and store encryption keys. Data for the security register is loaded from the OTP on power up. All additional data in OTP is copied from the OTP to SRAM and executed first on the processor.

The OTP memory is programmed using three special I/O ports: the OTP address port is a 16-bit port with resource ID 0x100200, the OTP data is written via a 32-bit port with resource ID 0x200100, and the OTP control is on a 16-bit port with ID 0x100300. Programming is performed through `libotp` and `xburn`.

9.2 SRAM

The xCORE Tile integrates a single 128KB SRAM bank for both instructions and data. All internal memory is 32 bits wide, and instructions are either 16-bit or 32-bit. Byte (8-bit), half-word (16-bit) or word (32-bit) accesses are supported and are executed within one tile clock cycle. There is no dedicated external memory interface, although data memory can be expanded through appropriate use of the ports.

10 USB PHY

The USB PHY provides High-Speed and Full-Speed, device, host, and on-the-go functionality. The PHY is configured through a set of peripheral registers (Appendix F), and data is communicated through ports on the digital node. A library, XUD, is provided to implement *USB-device* functionality.

The USB PHY is connected to the ports on Tile 0 and Tile 1 as shown in Figure 14. When the USB PHY is enabled on Tile 0, the ports shown can on Tile 0 only be used with the USB PHY. When the USB PHY is enabled on Tile 1, then the ports shown can on Tile 1 only be used with the USB PHY. All other IO pins and ports are unaffected. The USB PHY should not be enabled on both tiles. Two clock blocks can be used to clock the USB ports. One clock block for the TXDATA path, and one clock block for the RXDATA path. Details on how to connect those ports are documented in an application note on USB for xCORE-200.

An external resistor of 43.2 ohm (1% tolerance) should connect USB_RTUNE to ground, as close as possible to the device.

10.1 USB VBUS

USB_VBUS need not be connected if the device is wholly powered by USB, and the device is used to implement a *USB-device*.

capacitors should have as short a path back to the GND pins as possible. A bulk decoupling capacitor of at least 10 uF should be placed on each of these supplies.

RST_N is an active-low asynchronous-assertion global reset signal. Following a reset, the PLL re-establishes lock after which the device boots up according to the boot mode (*see* §8). RST_N and must be asserted low during and after power up for 100 ns.

12.1 USB connections

USB_VBUS should be connected to the VBUS pin of the USB connector. A 2.2 uF capacitor to ground is required on the VBUS pin. A ferrite bead may be used to reduce HF noise.

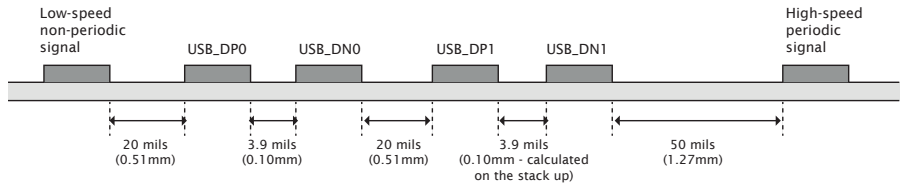
For self-powered systems, a bleeder resistor may be required to stop VBUS from floating when no USB cable is attached.

USB_DP and USB_DN should be connected to the USB connector. USB_ID does not need to be connected.

12.2 USB signal routing and placement

The USB_DP and USB_DN lines are the positive and negative data polarities of a high speed USB signal respectively. Their high-speed differential nature implies that they must be coupled and properly isolated. The board design must ensure that the board traces for USB_DP and USB_DN are tightly matched. In addition, according to the USB 2.0 specification, the USB_DP and USB_DN differential impedance must be 90 Ω.

Figure 19: USB trace separation showing a low speed signal, two differential pairs and a high-speed clock



12.2.1 General routing and placement guidelines

The following guidelines will help to avoid signal quality and EMI problems on high speed USB designs. They relate to a four-layer (Signal, GND, Power, Signal) PCB.

For best results, most of the routing should be done on the top layer (assuming the USB connector and XS2-U8A-128-TQ64 are on the top layer) closest to GND. Reference planes should be below the transmission lines in order to maintain control of the trace impedance.

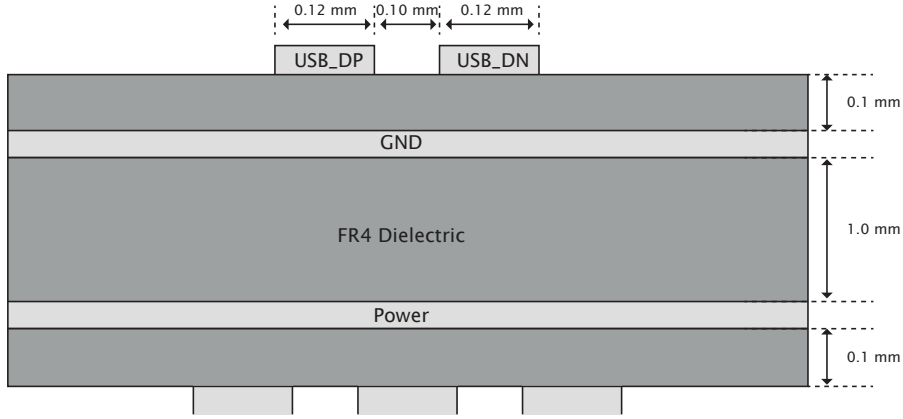


Figure 20: Example USB board stack

We recommend that the high-speed clock and high-speed USB differential pairs are routed first before any other routing. When routing high speed USB signals, the following guidelines should be followed:

- High speed differential pairs should be routed together.
- High-speed USB signal pair traces should be trace-length matched. Maximum trace-length mismatch should be no greater than 4mm.
- Ensure that high speed signals (clocks, USB differential pairs) are routed as far away from off-board connectors as possible.
- High-speed clock and periodic signal traces that run parallel should be at least 1.27mm away from USB_DP/USB_DN (see Figure 19).
- Low-speed and non-periodic signal traces that run parallel should be at least 0.5mm away from USB_DP/USB_DN (see Figure 19).
- Route high speed USB signals on the top of the PCB wherever possible.
- Route high speed USB traces over continuous power planes, with no breaks. If a trade-off must be made, changing signal layers is preferable to crossing plane splits.
- Follow the $20 \times h$ rule; keep traces $20 \times h$ (the height above the power plane) away from the edge of the power plane.
- Use a minimum of vias in high speed USB traces.
- Avoid corners in the trace. Where necessary, rather than turning through a 90 degree angle, use two 45 degree turns or an arc.
- DO NOT route USB traces near clock sources, clocked circuits or magnetic devices.

13.5 Power Consumption

Symbol	Parameter	MIN	TYP	MAX	UNITS	Notes
I(DDCQ)	Quiescent VDD current		45		mA	A, B, C
PD	Tile power dissipation		325		µW/MIPS	A, D, E, F
IDD	Active VDD current		170	375	mA	A, G, H
I(ADDPLL)	PLL_AVDD current		5	7	mA	I
I(VDD33)	VDD33 current		26.7		mA	J
I(USB_VDD)	USB_VDD current		8.27		mA	K

Figure 26: xCORE Tile currents

A Use for budgetary purposes only.

B Assumes typical tile and I/O voltages with no switching activity.

C Includes PLL current.

D Assumes typical tile and I/O voltages with nominal switching activity.

E Assumes 1 MHz = 1 MIPS.

F PD(TYP) value is the usage power consumption under typical operating conditions.

G Measurement conditions: VDD = 1.0 V, VDDIO = 3.3 V, 25 °C, 500 MHz, average device resource usage.

H Typical application and conditions: VDD = 1.0 V, VDDIO = 3.3 V, 25 °C, 500 MHz, USB Audio stereo out @ 192 kHz.

I PLL_AVDD = 1.0 V

J HS mode transmitting while driving all 0's data (constant JKJK on DP/DM). Loading of 10 pF. Transfers do not include any interpacket delay.

K HS receive mode; no traffic.

The tile power consumption of the device is highly application dependent and should be used for budgetary purposes only.

More detailed power analysis can be found in the XS1-U Power Consumption document,

13.6 Clock

Symbol	Parameter	MIN	TYP	MAX	UNITS	Notes
f	Frequency	9	24	25	MHz	
SR	Slew rate	0.10			V/ns	
TJ(LT)	Long term jitter (pk-pk)			2	%	A
f(MAX)	Processor clock frequency			500	MHz	B

Figure 27: Clock

A Percentage of CLK period.

B Assumes typical tile and I/O voltages with nominal activity.

Further details can be found in the XS1-U Clock Frequency Control document,

Appendices

A Configuration of the XU208-128-TQ64

The device is configured through banks of registers, as shown in Figure 33.

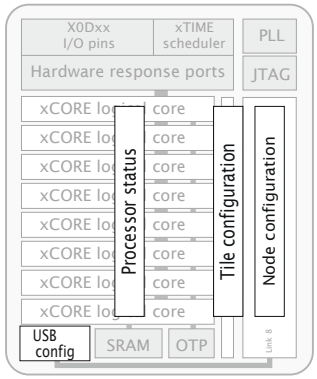

Figure 33: Registers

The following communication sequences specify how to access those registers. Any messages transmitted contain the most significant 24 bits of the channel-end to which a response is to be sent. This comprises the node-identifier and the channel number within the node. if no response is required on a write operation, supply 24-bits with the last 8-bits set, which suppresses the reply message. Any multi-byte data is sent most significant byte first.

A.1 Accessing a processor status register

The processor status registers are accessed directly from the processor instruction set. The instructions GETPS and SETPS read and write a word. The register number should be translated into a processor-status resource identifier by shifting the register number left 8 places, and ORing it with 0x0B. Alternatively, the functions `getps(reg)` and `setps(reg,value)` can be used from XC.

A.2 Accessing an xCORE Tile configuration register

xCORE Tile configuration registers can be accessed through the interconnect using the functions `write_tile_config_reg(tileref, ...)` and `read_tile_config_reg(tile ↪ ref, ...)`, where `tileref` is the name of the xCORE Tile, e.g. `tile[1]`. These functions implement the protocols described below.

Instead of using the functions above, a channel-end can be allocated to communicate with the xCORE tile configuration registers. The destination of the channel-end should be set to `0xnnnnC20C` where `nnnnnn` is the tile-identifier.

A write message comprises the following:

0x12: Debug SSP

Bits	Perm	Init	Description
31:0	DRW		Value.

B.15 DGETREG operand 1: 0x13

The resource ID of the logical core whose state is to be read.

0x13: DGETREG operand 1

Bits	Perm	Init	Description
31:8	RO	-	Reserved
7:0	DRW		Thread number to be read

B.16 DGETREG operand 2: 0x14

Register number to be read by DGETREG

0x14: DGETREG operand 2

Bits	Perm	Init	Description
31:5	RO	-	Reserved
4:0	DRW		Register number to be read

B.17 Debug interrupt type: 0x15

Register that specifies what activated the debug interrupt.

0x15: Debug interrupt type

Bits	Perm	Init	Description
31:18	RO	-	Reserved
17:16	DRW		Number of the hardware breakpoint/watchpoint which caused the interrupt (always 0 for =HOST= and =DCALL=). If multiple breakpoints/watchpoints trigger at once, the lowest number is taken.
15:8	DRW		Number of thread which caused the debug interrupt (always 0 in the case of =HOST=).
7:3	RO	-	Reserved
2:0	DRW	0	Indicates the cause of the debug interrupt 1: Host initiated a debug interrupt through JTAG 2: Program executed a DCALL instruction 3: Instruction breakpoint 4: Data watch point 5: Resource watch point

0x30 .. 0x33: Instruction breakpoint address

Bits	Perm	Init	Description
31:0	DRW		Value.

B.22 Instruction breakpoint control: 0x40 .. 0x43

This register controls which logical cores may take an instruction breakpoint, and under which condition.

0x40 .. 0x43: Instruction breakpoint control

Bits	Perm	Init	Description
31:24	RO	-	Reserved
23:16	DRW	0	A bit for each thread in the machine allowing the breakpoint to be enabled individually for each thread.
15:2	RO	-	Reserved
1	DRW	0	When 0 break when PC == IBREAK_ADDR. When 1 = break when PC != IBREAK_ADDR.
0	DRW	0	When 1 the instruction breakpoint is enabled.

B.23 Data watchpoint address 1: 0x50 .. 0x53

This set of registers contains the first address for the four data watchpoints.

0x50 .. 0x53: Data watchpoint address 1

Bits	Perm	Init	Description
31:0	DRW		Value.

B.24 Data watchpoint address 2: 0x60 .. 0x63

This set of registers contains the second address for the four data watchpoints.

0x60 .. 0x63: Data watchpoint address 2

Bits	Perm	Init	Description
31:0	DRW		Value.

B.25 Data breakpoint control register: 0x70 .. 0x73

This set of registers controls each of the four data watchpoints.

0x70 .. 0x73: Data breakpoint control register

Bits	Perm	Init	Description
31:24	RO	-	Reserved
23:16	DRW	0	A bit for each thread in the machine allowing the breakpoint to be enabled individually for each thread.
15:3	RO	-	Reserved
2	DRW	0	When 1 the breakpoints will be be triggered on loads.
1	DRW	0	Determines the break condition: 0 = A AND B, 1 = A OR B.
0	DRW	0	When 1 the instruction breakpoint is enabled.

B.26 Resources breakpoint mask: 0x80 .. 0x83

This set of registers contains the mask for the four resource watchpoints.

0x80 .. 0x83: Resources breakpoint mask

Bits	Perm	Init	Description
31:0	DRW		Value.

B.27 Resources breakpoint value: 0x90 .. 0x93

This set of registers contains the value for the four resource watchpoints.

0x90 .. 0x93: Resources breakpoint value

Bits	Perm	Init	Description
31:0	DRW		Value.

B.28 Resources breakpoint control register: 0x9C .. 0x9F

This set of registers controls each of the four resource watchpoints.

D.2 System switch description: 0x01

This register specifies the number of processors and links that are connected to this switch.

0x01: System switch description

Bits	Perm	Init	Description
31:24	RO	-	Reserved
23:16	RO		Number of SLinks on the SSwitch.
15:8	RO		Number of processors on the SSwitch.
7:0	RO		Number of processors on the device.

D.3 Switch configuration: 0x04

This register enables the setting of two security modes (that disable updates to the PLL or any other registers) and the header-mode.

0x04: Switch configuration

Bits	Perm	Init	Description
31	RW	0	0 = SSCTL registers have write access. 1 = SSCTL registers can not be written to.
30:9	RO	-	Reserved
8	RW	0	0 = PLL_CTL_REG has write access. 1 = PLL_CTL_REG can not be written to.
7:1	RO	-	Reserved
0	RW	0	0 = 2-byte headers, 1 = 1-byte headers (reset as 0).

D.4 Switch node identifier: 0x05

This register contains the node identifier.

0x05: Switch node identifier

Bits	Perm	Init	Description
31:16	RO	-	Reserved
15:0	RW	0	The unique ID of this node.

D.5 PLL settings: 0x06

An on-chip PLL multiplies the input clock up to a higher frequency clock, used to clock the I/O, processor, and switch, see Oscillator. Note: a write to this register will cause the tile to be reset.

0x06: PLL settings

Bits	Perm	Init	Description
31	RW		If set to 1, the chip will not be reset
30	RW		If set to 1, the chip will not wait for the PLL to re-lock. Only use this if a gradual change is made to the PLL
29	DW		If set to 1, set the PLL to be bypassed
28	DW		If set to 1, set the boot mode to boot from JTAG
27:26	RO	-	Reserved
25:23	RW		Output divider value range from 1 (8'h0) to 250 (8'hF9). P value.
22:21	RO	-	Reserved
20:8	RW		Feedback multiplication ratio, range from 1 (8'h0) to 255 (8'hFE). M value.
7	RO	-	Reserved
6:0	RW		Oscilator input divider value range from 1 (8'h0) to 32 (8'h0F). N value.

D.6 System switch clock divider: 0x07

Sets the ratio of the PLL clock and the switch clock.

0x07: System switch clock divider

Bits	Perm	Init	Description
31:16	RO	-	Reserved
15:0	RW	0	SSwitch clock generation

D.7 Reference clock: 0x08

Sets the ratio of the PLL clock and the reference clock used by the node.

0x08: Reference clock

Bits	Perm	Init	Description
31:16	RO	-	Reserved
15:0	RW	3	Software ref. clock divider

0x0D: Directions 8-15

Bits	Perm	Init	Description
31:28	RW	0	The direction for packets whose dimension is F.
27:24	RW	0	The direction for packets whose dimension is E.
23:20	RW	0	The direction for packets whose dimension is D.
19:16	RW	0	The direction for packets whose dimension is C.
15:12	RW	0	The direction for packets whose dimension is B.
11:8	RW	0	The direction for packets whose dimension is A.
7:4	RW	0	The direction for packets whose dimension is 9.
3:0	RW	0	The direction for packets whose dimension is 8.

D.12 Reserved: 0x10

Reserved.

0x10: Reserved

Bits	Perm	Init	Description
31:2	RO	-	Reserved
1	RW	0	Reserved.
0	RW	0	Reserved.

D.13 Reserved.: 0x11

Reserved.

0x11: Reserved.

Bits	Perm	Init	Description
31:2	RO	-	Reserved
1	RW	0	Reserved.
0	RW	0	Reserved.

D.14 Debug source: 0x1F

Contains the source of the most recent debug event.

Bits	Perm	Init	Description
31:26	RO	-	Reserved
25:24	RO		Identify the SRC_TARGET type 0 - SLink, 1 - PLink, 2 - SSCTL, 3 - Undefine.
23:16	RO		When the link is in use, this is the destination link number to which all packets are sent.
15:6	RO	-	Reserved
5:4	RW	0	Determines the network to which this link belongs, reset as 0.
3	RO	-	Reserved
2	RO		1 when the current packet is considered junk and will be thrown away.
1	RO		1 when the dest side of the link is in use.
0	RO		1 when the source side of the link is in use.

0x40 .. 0x47: PLink status and network

D.17 Link configuration and initialization: 0x80 .. 0x88

These registers contain configuration and debugging information specific to external links. The link speed and width can be set, the link can be initialized, and the link status can be monitored. The registers control links 0..7.

Bits	Perm	Init	Description
31	RW		Write to this bit with '1' will enable the XLink, writing '0' will disable it. This bit controls the muxing of ports with overlapping xlinks.
30	RW	0	0: operate in 2 wire mode; 1: operate in 5 wire mode
29:28	RO	-	Reserved
27	RO		Rx buffer overflow or illegal token encoding received.
26	RO	0	This end of the xlink has issued credit to allow the remote end to transmit
25	RO	0	This end of the xlink has credit to allow it to transmit.
24	WO		Clear this end of the xlink's credit and issue a HELLO token.
23	WO		Reset the receiver. The next symbol that is detected will be the first symbol in a token.
22	RO	-	Reserved
21:11	RW	0	Specify min. number of idle system clocks between two continuous symbols witin a transmit token -1.
10:0	RW	0	Specify min. number of idle system clocks between two continuous transmit tokens -1.

0x80 .. 0x88: Link configuration and initialization

E USB Node Configuration

The USB node control registers can be accessed using configuration reads and writes (use `write_node_config_reg(device, ...)` and `read_node_config_reg(device, ...)` for reads and writes).

Figure 37: Summary

Number	Perm	Description
0x00	RO	Device identification register
0x04	RW	Node configuration register
0x05	RW	Node identifier
0x51	RW	System clock frequency
0x80	RW	Link Control and Status

E.1 Device identification register: 0x00

This register contains version information, and information on power-on behavior.

0x00: Device identification register

Bits	Perm	Init	Description
31:24	RO	0x0F	Chip identifier
23:16	RO	-	Reserved
15:8	RO	0x02	Revision number of the USB block
7:0	RO	0x00	Version number of the USB block

E.2 Node configuration register: 0x04

This register is used to set the communication model to use (1 or 3 byte headers), and to prevent any further updates.

0x04: Node configuration register

Bits	Perm	Init	Description
31	RW	0	Set to 1 to disable further updates to the node configuration and link control and status registers.
30:1	RO	-	Reserved
0	RW	0	Header mode. 0: 3-byte headers; 1: 1-byte headers.

F.7 UIFM Serial Control: 0x18

0x18: UIFM Serial Control

Bits	Perm	Init	Description
31:7	RO	-	Reserved
6	RO	0	1 if UIFM is in UTMI+ RXRCV mode.
5	RO	0	1 if UIFM is in UTMI+ RXDM mode.
4	RO	0	1 if UIFM is in UTMI+ RXDP mode.
3	RW	0	Set to 1 to switch UIFM to UTMI+ TXSE0 mode.
2	RW	0	Set to 1 to switch UIFM to UTMI+ TXDATA mode.
1	RW	1	Set to 0 to switch UIFM to UTMI+ TXENABLE mode.
0	RW	0	Set to 1 to switch UIFM to UTMI+ FSLSSERIAL mode.

F.8 UIFM signal flags: 0x1C

Set of flags that monitor line and error states. These flags normally clear on the next packet, but they may be made sticky by using PER_UIFM_FLAGS_STICKY, in which they must be cleared explicitly.

0x1C: UIFM signal flags

Bits	Perm	Init	Description
31:7	RO	-	Reserved
6	RW	0	Set to 1 when the UIFM decodes a token successfully (e.g. it passes CRC5, PID check and has matching device address).
5	RW	0	Set to 1 when linestate indicates an SE0 symbol.
4	RW	0	Set to 1 when linestate indicates a K symbol.
3	RW	0	Set to 1 when linestate indicates a J symbol.
2	RW	0	Set to 1 if an incoming datapacket fails the CRC16 check.
1	RW	0	Set to the value of the UTMI_RXACTIVE input signal.
0	RW	0	Set to the value of the UTMI_RXERROR input signal

F.9 UIFM Sticky flags: 0x20

These bits define the sticky-ness of the bits in the UIFM IFM FLAGS register. A 1 means that bit will be sticky (hold its value until a 1 is written to that bitfield), or normal, in which case signal updates to the UIFM IFM FLAGS bits may be over-written by subsequent changes in those signals.

H Schematics Design Check List

☑ This section is a checklist for use by schematics designers using the XU208-128-TQ64. Each of the following sections contains items to check for each design.

H.1 Power supplies

☐ VDDIO and OTP_VCC supply is within specification before the VDD (core) supply is turned on. Specifically, the VDDIO and OTP_VCC supply is within specification before VDD (core) reaches 0.4V (Section 12).

☐ The VDD (core) supply ramps monotonically (rises constantly) from 0V to its final value (0.95V - 1.05V) within 10ms (Section 12).

☐ The VDD (core) supply is capable of supplying 375 mA (Section 12 and Figure 22).

☐ PLL_AVDD is filtered with a low pass filter, for example an RC filter, see Section 12 .

H.2 Power supply decoupling

☐ The design has multiple decoupling capacitors per supply, for example at least four0402 or 0603 size surface mount capacitors of 100nF in value, per supply (Section 12).

☐ A bulk decoupling capacitor of at least 10uF is placed on each supply (Section 12).

H.3 Power on reset

☐ The RST_N pins are asserted (low) during or after power up. The device is not used until these resets have taken place.

H.4 Clock

☐ The CLK input pin is supplied with a clock with monotonic rising edges and low jitter.

☐ You have chosen an input clock frequency that is supported by the device (Section 7).
