Welcome to E-XFL.COM

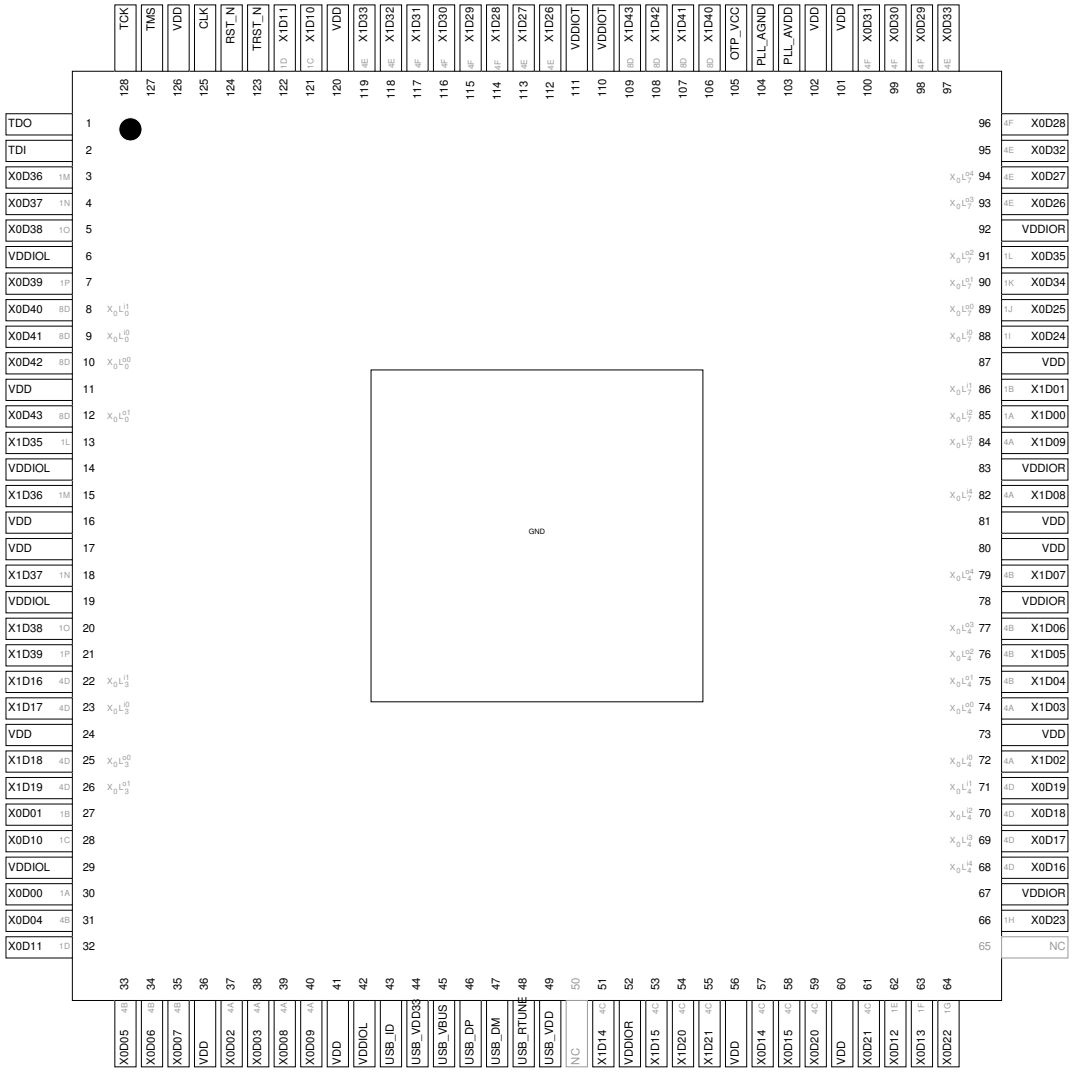
What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Active
Core Processor	XCore
Core Size	32-Bit 16-Core
Speed	2000MIPS
Connectivity	USB
Peripherals	-
Number of I/O	81
Program Memory Size	-
Program Memory Type	ROMless
EEPROM Size	-
RAM Size	256K x 8
Voltage - Supply (Vcc/Vdd)	0.95V ~ 3.6V
Data Converters	-
Oscillator Type	External
Operating Temperature	-40°C ~ 85°C (TA)
Mounting Type	Surface Mount
Package / Case	128-TQFP Exposed Pad
Supplier Device Package	128-TQFP (14x14)
Purchase URL	https://www.e-xfl.com/product-detail/xmos/xu216-256-tq128-i20

3 Pin Configuration



Signal	Function						Type	Properties
X0D41	$X_0L0^0_{in}$			$8D^5$	$16B^{13}$		I/O	IOL, PD
X0D42	$X_0L0^0_{out}$			$8D^6$	$16B^{14}$		I/O	IOL, PD
X0D43	$X_0L0^1_{out}$			$8D^7$	$16B^{15}$		I/O	IOL, PD
X1D00	$X_0L7^2_{in}$	$1A^0$					I/O	IOR, PD

X1D04	$X_0L4^1_{out}$		$4B^0$	$8A^2$	$16A^2$	$32A^{22}$	I/O	IOR, PD
X1D05	$X_0L4^2_{out}$		$4B^1$	$8A^3$	$16A^3$	$32A^{23}$	I/O	IOR, PD
X1D06	$X_0L4^3_{out}$		$4B^2$	$8A^4$	$16A^4$	$32A^{24}$	I/O	IOR, PD
X1D07	$X_0L4^4_{out}$		$4B^3$	$8A^5$	$16A^5$	$32A^{25}$	I/O	IOR, PD
X1D08	$X_0L7^4_{in}$		$4A^2$	$8A^6$	$16A^6$	$32A^{26}$	I/O	IOR, PD
X1D09	$X_0L7^3_{in}$		$4A^3$	$8A^7$	$16A^7$	$32A^{27}$	I/O	IOR, PD
X1D10		$1C^0$					I/O	IOT, PD
X1D11		$1D^0$					I/O	IOT, PD
X1D14			$4C^0$	$8B^0$	$16A^8$	$32A^{28}$	I/O	IOR, PD
X1D15			$4C^1$	$8B^1$	$16A^9$	$32A^{29}$	I/O	IOR, PD
X1D16	$X_0L3^1_{in}$		$4D^0$	$8B^2$	$16A^{10}$		I/O	IOL, PD
X1D17	$X_0L3^0_{in}$		$4D^1$	$8B^3$	$16A^{11}$		I/O	IOL, PD
X1D18	$X_0L3^0_{out}$		$4D^2$	$8B^4$	$16A^{12}$		I/O	IOL, PD
X1D19	$X_0L3^1_{out}$		$4D^3$	$8B^5$	$16A^{13}$		I/O	IOL, PD
X1D20			$4C^2$	$8B^6$	$16A^{14}$	$32A^{30}$	I/O	IOR, PD
X1D21			$4C^3$	$8B^7$	$16A^{15}$	$32A^{31}$	I/O	IOR, PD
X1D26			$4E^0$	$8C^0$	$16B^0$		I/O	IOT, PD
X1D27			$4E^1$	$8C^1$	$16B^1$		I/O	IOT, PD
X1D28			$4F^0$	$8C^2$	$16B^2$		I/O	IOT, PD
X1D29			$4F^1$	$8C^3$	$16B^3$		I/O	IOT, PD
X1D30			$4F^2$	$8C^4$	$16B^4$		I/O	IOT, PD
X1D31			$4F^3$	$8C^5$	$16B^5$		I/O	IOT, PD
X1D32			$4E^2$	$8C^6$	$16B^6$		I/O	IOT, PD
X1D33			$4E^3$	$8C^7$	$16B^7$		I/O	IOT, PD
X1D35		$1L^0$					I/O	IOL, PD
X1D36		$1M^0$		$8D^0$	$16B^8$		I/O	IOL, PD
X1D37		$1N^0$		$8D^1$	$16B^9$		I/O	IOL, PD
X1D38		$1O^0$		$8D^2$	$16B^{10}$		I/O	IOL, PD
X1D39		$1P^0$		$8D^3$	$16B^{11}$		I/O	IOL, PD
X1D40				$8D^4$	$16B^{12}$		I/O	IOT, PD
X1D41				$8D^5$	$16B^{13}$		I/O	IOT, PD
X1D42				$8D^6$	$16B^{14}$		I/O	IOT, PD
X1D43				$8D^7$	$16B^{15}$		I/O	IOT, PD

usb pins (5)			
Signal	**Function**	**Type**	**Properties**
USB_DM	USB Serial Data Inverted	I/O	
USB_DP	USB Serial Data	I/O	
USB_ID	USB Device ID (OTG) - Reserved	I/O	
USB_RTUNE	USB resistor	I/O	
USB_VBUS	USB Power Detect Pin	I/O	

System pins (1)			
Signal	**Function**	**Type**	**Properties**
CLK	PLL reference clock	Input	IOL, PD, ST

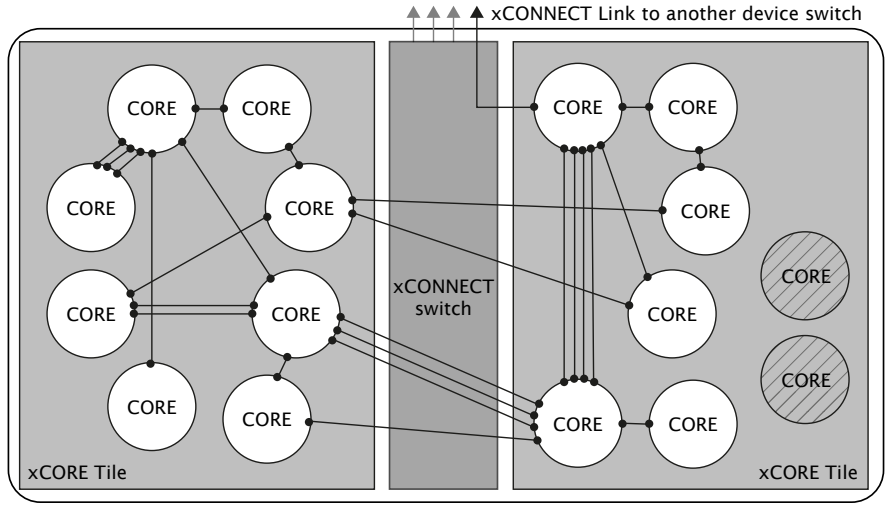

Figure 6: Switch, links and channel ends

and packet switched data can both be supported efficiently. Streams provide the fastest possible data rates between xCORE Tiles (up to 250 MBit/s), but each stream requires a single link to be reserved between switches on two tiles. All packet communications can be multiplexed onto a single link.

Information on the supported routing topologies that can be used to connect multiple devices together can be found in the XS1-U Link Performance and Design Guide, X2999.

7 PLL

The PLL creates a high-speed clock that is used for the switch, tile, and reference clock. The initial PLL multiplication value is shown in Figure 7:

Figure 7: The initial PLL multiplier values

Oscillator Frequency	Tile Boot Frequency	PLL Ratio	PLL settings		
			OD	F	R
9-25 MHz	144-400 MHz	16	1	63	0

Figure 7 also lists the values of OD, F and R, which are the registers that define the ratio of the tile frequency to the oscillator frequency:

$$F_{core} = F_{osc} \times \frac{F+1}{2} \times \frac{1}{R+1} \times \frac{1}{OD+1}$$

OD, F and R must be chosen so that $0 \leq R \leq 63$, $0 \leq F \leq 4095$, $0 \leq OD \leq 7$, and $260MHz \leq F_{osc} \times \frac{F+1}{2} \times \frac{1}{R+1} \leq 1.3GHz$. The OD, F, and R values can be modified by writing to the digital node PLL configuration register.

If the USB PHY is used, then either a 24 MHz or 12 MHz oscillator must be used.

If a different tile frequency is required (eg, 500 MHz), then the PLL must be reprogrammed after boot to provide the required tile frequency. The XMOS tools perform this operation by default. Further details on configuring the clock can be found in the xCORE-200 Clock Frequency Control document.

8 Boot Procedure

The device is kept in reset by driving RST_N low. When in reset, all GPIO pins have a pull-down enabled. When the device is taken out of reset by releasing RST_N the processor starts its internal reset process. After 15-150 μs (depending on the input clock) the processor boots.

The xCORE Tile boot procedure is illustrated in Figure 8. If bit 5 of the security register (*see* §9.1) is set, the device boots from OTP. To get a high value, a 3K3 pull-up resistor should be strapped onto the pin. To assure a low value, a pull-down resistor is required if other external devices are connected to this port.

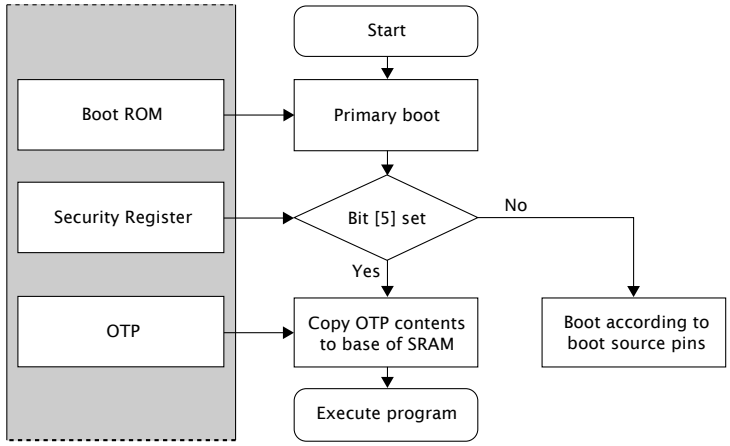

Figure 8: Boot procedure

X0D06	X0D05	X0D04	Tile 0 boot	Tile 1 boot	Enabled links
0	0	0	QSPI master	Channel end 0	None
0	0	1	SPI master	Channel end 0	None
0	1	0	SPI slave	Channel end 0	None
0	1	1	SPI slave	SPI slave	None
1	0	0	Channel end 0	Channel end 0	XL0 (2w)

Figure 9: Boot source pins

The boot image has the following format:

- A 32-bit program size s in words.
- Program consisting of $s \times 4$ bytes.

9 Memory

9.1 OTP

Each xCORE Tile integrates 8 KB one-time programmable (OTP) memory along with a security register that configures system wide security features. The OTP holds data in four sectors each containing 512 rows of 32 bits which can be used to implement secure bootloaders and store encryption keys. Data for the security register is loaded from the OTP on power up. All additional data in OTP is copied from the OTP to SRAM and executed first on the processor.

The OTP memory is programmed using three special I/O ports: the OTP address port is a 16-bit port with resource ID 0x100200, the OTP data is written via a 32-bit port with resource ID 0x200100, and the OTP control is on a 16-bit port with ID 0x100300. Programming is performed through `libotp` and `xburn`.

9.2 SRAM

Each xCORE Tile integrates a single 128KB SRAM bank for both instructions and data. All internal memory is 32 bits wide, and instructions are either 16-bit or 32-bit. Byte (8-bit), half-word (16-bit) or word (32-bit) accesses are supported and are executed within one tile clock cycle. There is no dedicated external memory interface, although data memory can be expanded through appropriate use of the ports.

10 USB PHY

The USB PHY provides High-Speed and Full-Speed, device, host, and on-the-go functionality. The PHY is configured through a set of peripheral registers (Appendix F), and data is communicated through ports on the digital node. A library, XUD, is provided to implement *USB-device* functionality.

The USB PHY is connected to the ports on Tile 0 and Tile 1 as shown in Figure 14. When the USB PHY is enabled on Tile 0, the ports shown can on Tile 0 only be used with the USB PHY. When the USB PHY is enabled on Tile 1, then the ports shown can on Tile 1 only be used with the USB PHY. All other IO pins and ports are unaffected. The USB PHY should not be enabled on both tiles. Two clock blocks can be used to clock the USB ports. One clock block for the TXDATA path, and one clock block for the RXDATA path. Details on how to connect those ports are documented in an application note on USB for xCORE-200.

An external resistor of 43.2 ohm (1% tolerance) should connect USB_RTUNE to ground, as close as possible to the device.

10.1 USB VBUS

USB_VBUS need not be connected if the device is wholly powered by USB, and the device is used to implement a *USB-device*.

The JTAG usercode register can be read by using the USERCODE instruction. Its contents are specified in Figure 18. The OTP User ID field is read from bits [22:31] of the security register on xCORE Tile 0, *see* §9.1 (all zero on unprogrammed devices).

Figure 18: USERCODE return value

Bit31										Usercode Register																				Bit0
OTP User ID										Unused				Silicon Revision																
0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0
0				0				0				2				8				0				0						

12 Board Integration

The device has the following power supply pins:

- VDD pins for the xCORE Tile, including a USB_VDD pin that powers the USB PHY
- VDDIO pins for the I/O lines. Separate I/O supplies are provided for the left, top, and right side of the package; different I/O voltages may be supplied on those. The signal description (Section 4) specifies which I/O is powered from which power-supply
- PLL_AVDD pins for the PLL
- OTP_VCC pins for the OTP
- A USB_VDD33 pin for the analogue supply to the USB-PHY

Several pins of each type are provided to minimize the effect of inductance within the package, all of which must be connected. The power supplies must be brought up monotonically and input voltages must not exceed specification at any time.

The VDD supply must ramp from 0 V to its final value within 10 ms to ensure correct startup.

The VDDIO and OTP_VCC supply must ramp to its final value before VDD reaches 0.4 V.

The PLL_AVDD supply should be separated from the other noisier supplies on the board. The PLL requires a very clean power supply, and a low pass filter (for example, a 4.7 Ω resistor and 100 nF multi-layer ceramic capacitor) is recommended on this pin.

The following ground pins are provided:

- PLL_AGND for PLL_AVDD
- GND for all other supplies

All ground pins must be connected directly to the board ground.

The VDD and VDDIO supplies should be decoupled close to the chip by several 100 nF low inductance multi-layer ceramic capacitors between the supplies and GND

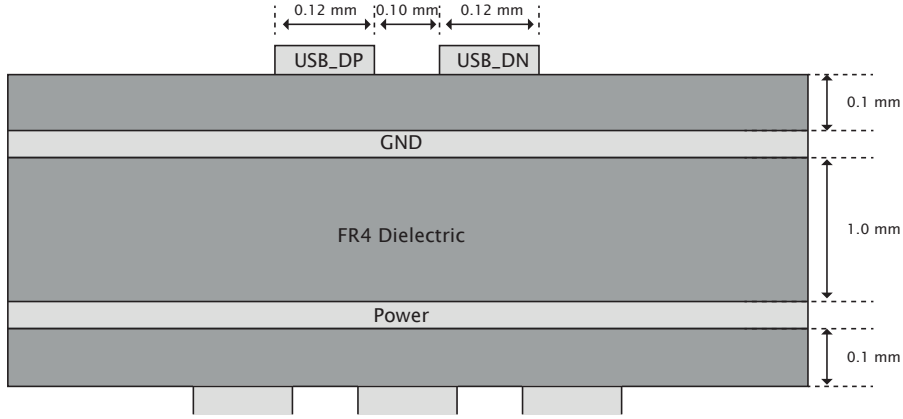

Figure 20: Example USB board stack

Reference planes should be below the transmission lines in order to maintain control of the trace impedance.

We recommend that the high-speed clock and high-speed USB differential pairs are routed first before any other routing. When routing high speed USB signals, the following guidelines should be followed:

- High speed differential pairs should be routed together.
- High-speed USB signal pair traces should be trace-length matched. Maximum trace-length mismatch should be no greater than 4mm.
- Ensure that high speed signals (clocks, USB differential pairs) are routed as far away from off-board connectors as possible.
- High-speed clock and periodic signal traces that run parallel should be at least 1.27mm away from USB_DP/USB_DN (see Figure 19).
- Low-speed and non-periodic signal traces that run parallel should be at least 0.5mm away from USB_DP/USB_DN (see Figure 19).
- Route high speed USB signals on the top of the PCB wherever possible.
- Route high speed USB traces over continuous power planes, with no breaks. If a trade-off must be made, changing signal layers is preferable to crossing plane splits.
- Follow the $20 \times h$ rule; keep traces $20 \times h$ (the height above the power plane) away from the edge of the power plane.
- Use a minimum of vias in high speed USB traces.
- Avoid corners in the trace. Where necessary, rather than turning through a 90 degree angle, use two 45 degree turns or an arc.

- DO NOT route USB traces near clock sources, clocked circuits or magnetic devices.
- Avoid stubs on high speed USB signals.

12.3 Land patterns and solder stencils

The package is a 128 pin Thin Quad Flat Package (TQFP) with exposed ground paddle/heat slug on a 0.4mm pitch.

The land patterns and solder stencils will depend on the PCB manufacturing process. We recommend you design them with using the IPC specifications *"Generic Requirements for Surface Mount Design and Land Pattern Standards"* IPC-7351B. This standard aims to achieve desired targets of heel, toe and side fillets for solder-joints. The mechanical drawings in Section 14 specify the dimensions and tolerances.

12.4 Ground and Thermal Vias

Vias under the heat slug into the ground plane of the PCB are recommended for a low inductance ground connection and good thermal performance. Typical designs could use 16 vias in a 4 x 4 grid, equally spaced across the heat slug.

12.5 Moisture Sensitivity

XMOS devices are, like all semiconductor devices, susceptible to moisture absorption. When removed from the sealed packaging, the devices slowly absorb moisture from the surrounding environment. If the level of moisture present in the device is too high during reflow, damage can occur due to the increased internal vapour pressure of moisture. Example damage can include bond wire damage, die lifting, internal or external package cracks and/or delamination.

All XMOS devices are Moisture Sensitivity Level (MSL) 3 - devices have a shelf life of 168 hours between removal from the packaging and reflow, provided they are stored below 30C and 60% RH. If devices have exceeded these values or an included moisture indicator card shows excessive levels of moisture, then the parts should be baked as appropriate before use. This is based on information from *Joint IPC/JEDEC Standard For Moisture/Reflow Sensitivity Classification For Nonhermetic Solid State Surface-Mount Devices* J-STD-020 Revision D.

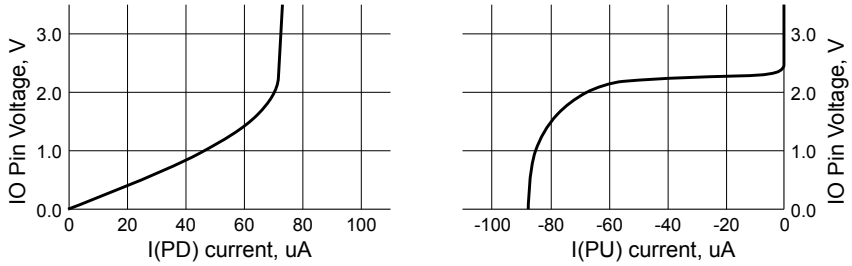

Figure 23: Typical internal pull-down and pull-up currents

13.3 ESD Stress Voltage

Figure 24: ESD stress voltage

Symbol	Parameter	MIN	TYP	MAX	UNITS	Notes
HBM	Human body model	-2.00		2.00	KV	
CDM	Charged Device Model	-500		500	V	

13.4 Reset Timing

Figure 25: Reset timing

Symbol	Parameters	MIN	TYP	MAX	UNITS	Notes
T(RST)	Reset pulse width	5			µs	
T(INIT)	Initialization time			150	µs	A

A Shows the time taken to start booting after RST_N has gone high.

14 Package Information

NOTE :
① DATUM A-B AND D TO DETERMINE AT DATUM PLANE H.
② TO BE DETERMINED AT SEATING DATUM PLAN C.
③ DIMENSION D1 AND E1 DO NOT INCLUDE MOLD PROTRUSIONS. ALLOWABLE PROTRUSION IS 0.25 mm PER SIDE. S1 AND E1 ARE MAXIMUM PLASTIC BODY SIZE DIMENSION INCLUDING MOLD MISMATCH.
④ DIMENSION b DOSE NOT INCLUDE DAMBAR PROTRUSION. ALLOWABLE DAMBAR PROTRUSION SHALL NOT CAUSE THE LEAD WIDTH TO EXCEED THE MAXIMUM b DIMENSION BY MORE THAN 0.08 mm. DAMBAR CANNOT BE LOCATED ON THE LOWER RADIUS OR THE FOOT. MINIMUM SPACE BETWEEN PROTRUSION AND ADJACENT LEAD IS 0.07 mm FOR 0.4mm AND 0.5 mm PITCH PACKAGE.
⑤ THESE DIMENSIONS APPLY TO THE FLAT SECTION OF THE BETWEEN 0.10 mm AND 0.25 mm FROM THE LEAD TIP.
⑥ A1 IS THE DEFINED AS THE DISTANCE FROM THE SEATING PLAN TO THE LOWEST POINT ON THE PACKAGE BODY.
⑦ PACKAGE LEAD COUNT IS NON-JEDEC STANDARD.

control-token 192	24-bit response channel-end identifier	16-bit register number	32-bit data	control-token 1

The response to a write message comprises either control tokens 3 and 1 (for success), or control tokens 4 and 1 (for failure).

A read message comprises the following:

control-token 193	24-bit response channel-end identifier	16-bit register number	control-token 1

The response to the read message comprises either control token 3, 32-bit of data, and control-token 1 (for success), or control tokens 4 and 1 (for failure).

A.3 Accessing node configuration

Node configuration registers can be accessed through the interconnect using the functions `write_node_config_reg(device, ...)` and `read_node_config_reg(device, ...)`, where `device` is the name of the node. These functions implement the protocols described below.

Instead of using the functions above, a channel-end can be allocated to communicate with the node configuration registers. The destination of the channel-end should be set to `0xnnnnC30C` where `nnnn` is the node-identifier.

A write message comprises the following:

control-token 192	24-bit response channel-end identifier	16-bit register number	32-bit data	control-token 1

The response to a write message comprises either control tokens 3 and 1 (for success), or control tokens 4 and 1 (for failure).

A read message comprises the following:

control-token 193	24-bit response channel-end identifier	16-bit register number	control-token 1

The response to a read message comprises either control token 3, 32-bit of data, and control-token 1 (for success), or control tokens 4 and 1 (for failure).

A.4 Accessing a register of an analogue peripheral

Peripheral registers can be accessed through the interconnect using the functions `write_periph_32(device, peripheral, ...)`, `read_periph_32(device, peripheral, ...)`, `write_periph_8(device, peripheral, ...)`, and `read_periph_8(device, peripheral, ...)`; where device is the name of the analogue device, and peripheral is the number of the peripheral. These functions implement the protocols described below.

A channel-end should be allocated to communicate with the configuration registers. The destination of the channel-end should be set to `0xnnnnpp02` where `nnnn` is the node-identifier and `pp` is the peripheral identifier.

A write message comprises the following:

control-token 36	24-bit response channel-end identifier	8-bit register number	8-bit size	data	control-token 1

The response to a write message comprises either control tokens 3 and 1 (for success), or control tokens 4 and 1 (for failure).

A read message comprises the following:

control-token 37	24-bit response channel-end identifier	8-bit register number	8-bit size	control-token 1

The response to the read message comprises either control token 3, data, and control-token 1 (for success), or control tokens 4 and 1 (for failure).

0x02: xCORE Tile control

Bits	Perm	Init	Description
31:26	RO	-	Reserved
25:18	RW	0	RGMII TX data delay value (in PLL output cycle increments)
17:9	RW	0	RGMII TX clock divider value. TX clk rises when counter (clocked by PLL output) reaches this value and falls when counter reaches (value»1). Value programmed into this field should be actual divide value required minus 1
8	RW	0	Enable RGMII interface periph ports
7:6	RO	-	Reserved
5	RW	0	Select the dynamic mode (1) for the clock divider when the clock divider is enabled. In dynamic mode the clock divider is only activated when all active threads are paused. In static mode the clock divider is always enabled.
4	RW	0	Enable the clock divider. This divides the output of the PLL to facilitate one of the low power modes.
3	RO	-	Reserved
2	RW		Select between UTMI (1) and ULPI (0) mode.
1	RW		Enable the ULPI Hardware support module
0	RO	-	Reserved

B.4 xCORE Tile boot status: 0x03

This read-only register describes the boot status of the xCORE tile.

0x03: xCORE Tile boot status

Bits	Perm	Init	Description
31:24	RO	-	Reserved
23:16	RO		Processor number.
15:9	RO	-	Reserved
8	RO		Overwrite BOOT_MODE.
7:6	RO	-	Reserved
5	RO		Indicates if core1 has been powered off
4	RO		Cause the ROM to not poll the OTP for correct read levels
3	RO		Boot ROM boots from RAM
2	RO		Boot ROM boots from JTAG
1:0	RO		The boot PLL mode pin value.

0x9C .. 0x9F: Resources breakpoint control register

Bits	Perm	Init	Description
31:24	RO	-	Reserved
23:16	DRW	0	A bit for each thread in the machine allowing the breakpoint to be enabled individually for each thread.
15:2	RO	-	Reserved
1	DRW	0	When 0 break when condition A is met. When 1 = break when condition B is met.
0	DRW	0	When 1 the instruction breakpoint is enabled.

0x62: SR of logical core 2

Bits	Perm	Init	Description
31:0	CRO		Value.

C.20 SR of logical core 3: 0x63

Value of the SR of logical core 3

Bits	Perm	Init	Description
31:0	CRO		Value.

C.21 SR of logical core 4: 0x64

Value of the SR of logical core 4

0x64: SR of logical core 4

Bits	Perm	Init	Description
31:0	CRO		Value.

C.22 SR of logical core 5: 0x65

Value of the SR of logical core 5

0x65: SR of logical core 5

Bits	Perm	Init	Description
31:0	CRO		Value.

C.23 SR of logical core 6: 0x66

Value of the SR of logical core 6

0x66: SR of logical core 6

Bits	Perm	Init	Description
31:0	CRO		Value.

D.8 System JTAG device ID register: 0x09

0x09: System JTAG device ID register

Bits	Perm	Init	Description
31:28	RO		
27:12	RO		
11:1	RO		
0	RO		

D.9 System USERCODE register: 0x0A

0x0A: System USERCODE register

Bits	Perm	Init	Description
31:18	RO		JTAG USERCODE value programmed into OTP SR
17:0	RO		metal fixable ID code

D.10 Directions 0-7: 0x0C

This register contains eight directions, for packets with a mismatch in bits 7..0 of the node-identifier. The direction in which a packet will be routed is goverened by the most significant mismatching bit.

0x0C: Directions 0-7

Bits	Perm	Init	Description
31:28	RW	0	The direction for packets whose dimension is 7.
27:24	RW	0	The direction for packets whose dimension is 6.
23:20	RW	0	The direction for packets whose dimension is 5.
19:16	RW	0	The direction for packets whose dimension is 4.
15:12	RW	0	The direction for packets whose dimension is 3.
11:8	RW	0	The direction for packets whose dimension is 2.
7:4	RW	0	The direction for packets whose dimension is 1.
3:0	RW	0	The direction for packets whose dimension is 0.

D.11 Directions 8-15: 0x0D

This register contains eight directions, for packets with a mismatch in bits 15..8 of the node-identifier. The direction in which a packet will be routed is goverened by the most significant mismatching bit.

0x10: UIFM on-the-go control

Bits	Perm	Init	Description
31:8	RO	-	Reserved
7	RW	0	Set to 1 to switch UIFM to EXTVBUSIND mode.
6	RW	0	Set to 1 to switch UIFM to DRVVBUSEXT mode.
5	RO	-	Reserved
4	RW	0	Set to 1 to switch UIFM to UTMI+ CHRGVBUS mode.
3	RW	0	Set to 1 to switch UIFM to UTMI+ DISCHRGVBUS mode.
2	RW	0	Set to 1 to switch UIFM to UTMI+ DMPULLDOWN mode.
1	RW	0	Set to 1 to switch UIFM to UTMI+ DPPULLDOWN mode.
0	RW	0	Set to 1 to switch UIFM to IDPULLUP mode.

F.6 UIFM on-the-go flags: 0x14

Status flags used for on-the-go negotiation

0x14: UIFM on-the-go flags

Bits	Perm	Init	Description
31:6	RO	-	Reserved
5	RO	0	Value of UTMI+ Bvalid flag.
4	RO	0	Value of UTMI+ IDGND flag.
3	RO	0	Value of UTMI+ HOSTDIS flag.
2	RO	0	Value of UTMI+ VBUSVLD flag.
1	RO	0	Value of UTMI+ SESSVLD flag.
0	RO	0	Value of UTMI+ SESSEND flag.

G JTAG, xSCOPE and Debugging

If you intend to design a board that can be used with the XMOS toolchain and xTAG debugger, you will need an xSYS header on your board. Figure 39 shows a decision diagram which explains what type of xSYS connectivity you need. The three subsections below explain the options in detail.

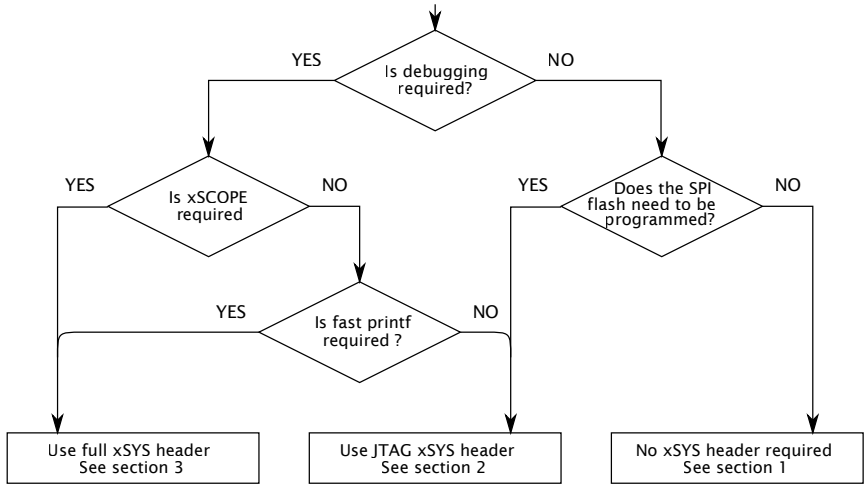

Figure 39: Decision diagram for the xSYS header

G.1 No xSYS header

The use of an xSYS header is optional, and may not be required for volume production designs. However, the XMOS toolchain expects the xSYS header; if you do not have an xSYS header then you must provide your own method for writing to flash/OTP and for debugging.

G.2 JTAG-only xSYS header

The xSYS header connects to an xTAG debugger, which has a 20-pin 0.1" female IDC header. The design will hence need a male IDC header. We advise to use a boxed header to guard against incorrect plug-ins. If you use a 90 degree angled header, make sure that pins 2, 4, 6, ..., 20 are along the edge of the PCB.

Connect pins 4, 8, 12, 16, 20 of the xSYS header to ground, and then connect:

- TDI to pin 5 of the xSYS header
- TMS to pin 7 of the xSYS header
- TCK to pin 9 of the xSYS header
- TDO to pin 13 of the xSYS header

The RST_N net should be open-drain, active-low, and have a pull-up to VDDIO.

G.3 Full xSYS header

For a full xSYS header you will need to connect the pins as discussed in Section G.2, and then connect a 2-wire xCONNECT Link to the xSYS header. The links can be found in the Signal description table (Section 4): they are labelled XL0, XL1, etc in the function column. The 2-wire link comprises two inputs and outputs, labelled $^{1}_{out}$, $^{0}_{out}$, $^{0}_{in}$, and $^{1}_{in}$. For example, if you choose to use XL0 for xSCOPE I/O, you need to connect up $XL0^{1}_{out}$, $XL0^{0}_{out}$, $XL0^{0}_{in}$, $XL0^{1}_{in}$ as follows:

- $XL0^{1}_{out}$ (X0D43) to pin 6 of the xSYS header with a 33R series resistor close to the device.
- $XL0^{0}_{out}$ (X0D42) to pin 10 of the xSYS header with a 33R series resistor close to the device.
- $XL0^{0}_{in}$ (X0D41) to pin 14 of the xSYS header.
- $XL0^{1}_{in}$ (X0D40) to pin 18 of the xSYS header.
