
Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Obsolete
Core Processor	80C51
Core Size	8-Bit
Speed	60MHz
Connectivity	SPI, UART/USART
Peripherals	POR, PWM, WDT
Number of I/O	34
Program Memory Size	64KB (64K x 8)
Program Memory Type	FLASH
EEPROM Size	2K x 8
RAM Size	2K x 8
Voltage - Supply (Vcc/Vdd)	2.7V ~ 5.5V
Data Converters	-
Oscillator Type	External
Operating Temperature	-40°C ~ 85°C (TA)
Mounting Type	Surface Mount
Package / Case	44-LQFP
Supplier Device Package	44-VQFP (10x10)
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/at89c51ed2-rlrim

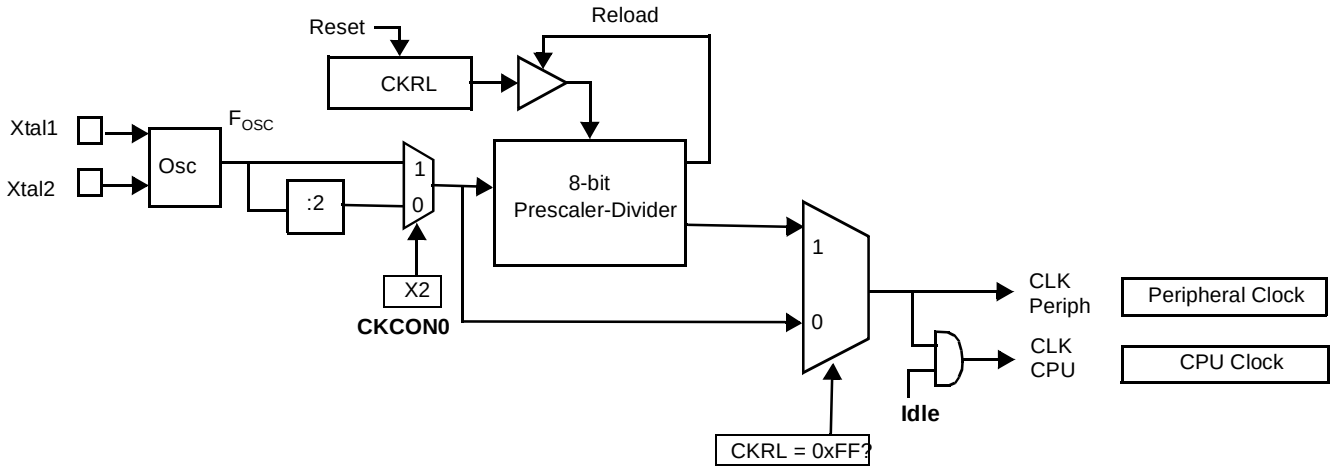
SFR Mapping

The Special Function Registers (SFRs) of the AT89C51RD2/ED2 fall into the following categories:

- C51 core registers: ACC, B, DPH, DPL, PSW, SP
- I/O port registers: P0, P1, P2, P3, PI2
- Timer registers: T2CON, T2MOD, TCON, TH0, TH1, TH2, TMOD, TL0, TL1, TL2, RCAP2L, RCAP2H
- Serial I/O port registers: SADDR, SADEN, SBUF, SCON
- PCA (Programmable Counter Array) registers: CCON, CCAPMx, CL, CH, CCAPxH, CCAPxL (x: 0 to 4)
- Power and clock control registers: PCON
- Hardware Watchdog Timer registers: WDTRST, WDTPRG
- Interrupt system registers: IE0, IPL0, IPH0, IE1, IPL1, IPH1
- Keyboard Interface registers: KBE, KBF, KBLS
- SPI registers: SPCON, SPSTR, SPDAT
- BRG (Baud Rate Generator) registers: BRL, BDRCON
- Clock Prescaler register: CKRL
- Others: AUXR, AUXR1, CKCON0, CKCON1

Functional Block Diagram

Figure 4. Functional Oscillator Block Diagram



Prescaler Divider

- A hardware RESET puts the prescaler divider in the following state:
  - CKRL = FFh: $F_{CLK\ CPU} = F_{CLK\ PERIPH} = F_{OSC}/2$ (Standard C51 feature)
- Any value between FFh down to 00h can be written by software into CKRL register in order to divide frequency of the selected oscillator:
  - CKRL = 00h: minimum frequency
    $F_{CLK\ CPU} = F_{CLK\ PERIPH} = F_{OSC}/1020$ (Standard Mode)
    $F_{CLK\ CPU} = F_{CLK\ PERIPH} = F_{OSC}/510$ (X2 Mode)
  - CKRL = FFh: maximum frequency
    $F_{CLK\ CPU} = F_{CLK\ PERIPH} = F_{OSC}/2$ (Standard Mode)
    $F_{CLK\ CPU} = F_{CLK\ PERIPH} = F_{OSC}$ (X2 Mode)

$F_{CLK\ CPU}$ and $F_{CLK\ PERIPH}$

In X2 Mode, for CKRL<>0xFF:

$$F_{CPU} = F_{CLKPERIPH} = \frac{F_{OSC}}{2 \times (255 - CKRL)}$$

In X1 Mode, for CKRL<>0xFF then:

$$F_{CPU} = F_{CLKPERIPH} = \frac{F_{OSC}}{4 \times (255 - CKRL)}$$

Registers

Table 19. AUXR Register

AUXR - Auxiliary Register (8Eh)

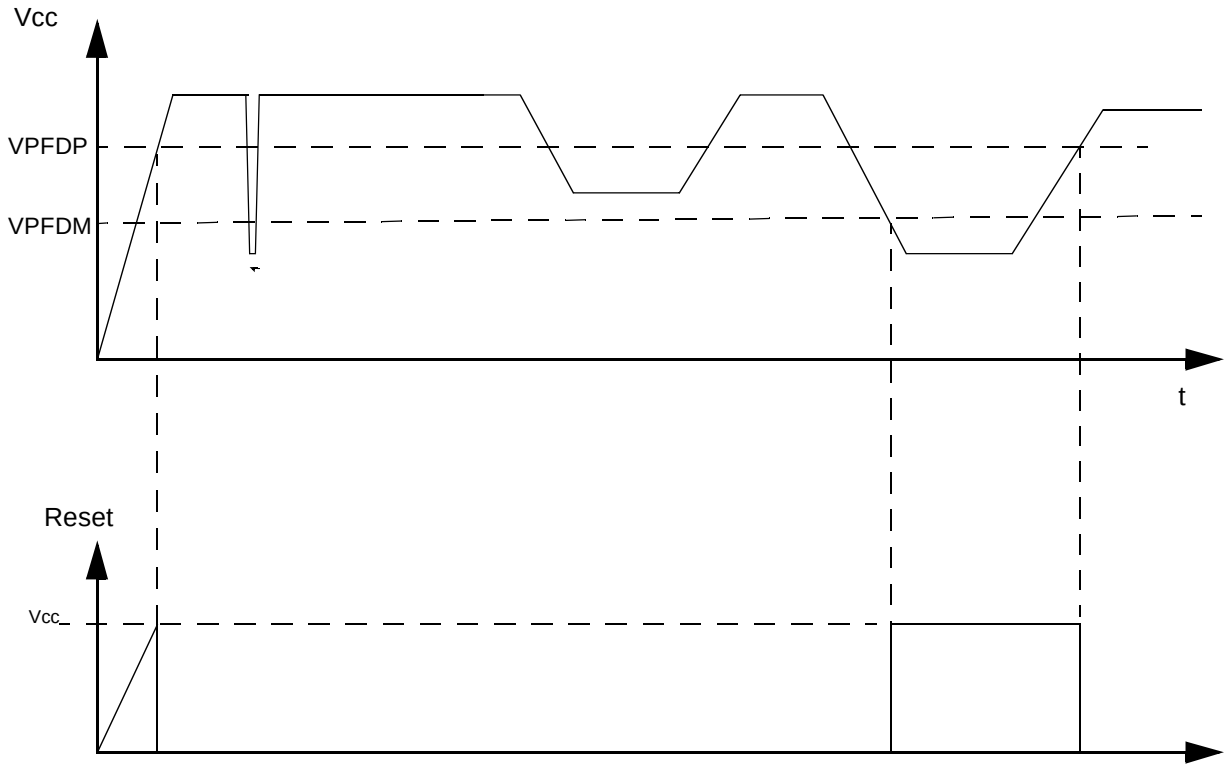
7	6	5	4	3	2	1	0
DPU	-	M0	XRS2	XRS1	XRS0	EXTRAM	AO

Bit Number	Bit Mnemonic	Description
7	DPU	**Disable Weak Pull-up** Cleared by software to activate the permanent weak pull-up (default) Set by software to disable the weak pull-up (reduce power consumption)
6	-	**Reserved** The value read from this bit is indeterminate. Do not set this bit.
5	M0	**Pulse length** Cleared to stretch MOVX control: the $\overline{RD}$ and the $\overline{WR}$ pulse length is 6 clock periods (default). Set to stretch MOVX control: the $\overline{RD}$ and the $\overline{WR}$ pulse length is 30 clock periods.
4 3 2	XRS2 XRS1 XRS0	**XRAM Size** XRS2 XRS1 XRS0 XRAM size 0 0 0 256 bytes 0 0 1 512 bytes 0 1 0 768 bytes(default) 0 1 1 1024 bytes 1 0 0 1792 bytes
1	EXTRAM	**EXTRAM bit** Cleared to access internal XRAM using movx @ Ri/ @ DPTR. Set to access external memory. Programmed by hardware after Power-up regarding Hardware Security Byte (HSB), default setting, XRAM selected.
0	AO	**ALE Output bit** Cleared, ALE is emitted at a constant rate of 1/6 the oscillator frequency (or 1/3 if X2 mode is used). (default) Set, ALE is active only during a MOVX or MOVC instruction is used.

Reset Value = 0X00 10'HSB. XRAM'0b
Not bit addressable

The Power fail detect monitor the supply generated by the voltage regulator and generate a reset if this supply falls below a safety threshold as illustrated in the Figure 13 below.

Figure 13. Power Fail Detect



When the power is applied, the Power Monitor immediately asserts a reset. Once the internal supply after the voltage regulator reach a safety level, the power monitor then looks at the XTAL clock input. The internal reset will remain asserted until the Xtal1 levels are above and below VIH and VIL. Further more. An internal counter will count 1024 clock periods before the reset is de-asserted.

If the internal power supply falls below a safety level, a reset is immediately asserted.

.

Registers

Table 20. T2CON Register

T2CON - Timer 2 Control Register (C8h)

7	6	5	4	3	2	1	0
TF2	**EXF2**	**RCLK**	**TCLK**	**EXEN2**	**TR2**	**C/T2#**	**CP/RL2#**

Bit Number	Bit Mnemonic	Description
7	TF2	**Timer 2 overflow Flag** Must be cleared by software. Set by hardware on Timer 2 overflow, if RCLK = 0 and TCLK = 0.
6	EXF2	**Timer 2 External Flag** Set when a capture or a reload is caused by a negative transition on T2EX pin if EXEN2 = 1. When set, causes the CPU to vector to Timer 2 interrupt routine when Timer 2 interrupt is enabled. Must be cleared by software. EXF2 doesn't cause an interrupt in Up/down counter mode (DCEN = 1).
5	RCLK	**Receive Clock bit** Cleared to use timer 1 overflow as receive clock for serial port in mode 1 or 3. Set to use Timer 2 overflow as receive clock for serial port in mode 1 or 3.
4	TCLK	**Transmit Clock bit** Cleared to use timer 1 overflow as transmit clock for serial port in mode 1 or 3. Set to use Timer 2 overflow as transmit clock for serial port in mode 1 or 3.
3	EXEN2	**Timer 2 External Enable bit** Cleared to ignore events on T2EX pin for Timer 2 operation. Set to cause a capture or reload when a negative transition on T2EX pin is detected, if Timer 2 is not used to clock the serial port.
2	TR2	**Timer 2 Run control bit** Cleared to turn off Timer 2. Set to turn on Timer 2.
1	C/T2#	**Timer/Counter 2 select bit** Cleared for timer operation (input from internal clock system: $F_{CLK\ PERIPH}$). Set for counter operation (input from T2 input pin, falling edge trigger). Must be 0 for clock out mode.
0	CP/RL2#	**Timer 2 Capture/Reload bi**t If RCLK = 1 or TCLK = 1, CP/RL2# is ignored and timer is forced to auto-reload on Timer 2 overflow. Cleared to auto-reload on Timer 2 overflows or negative transitions on T2EX pin if EXEN2=1. Set to capture on negative transitions on T2EX pin if EXEN2 = 1.

Reset Value = 0000 0000b

Table 23. CCON Register

CCON - PCA Counter Control Register (D8h)

7	6	5	4	3	2	1	0
CF	**CR**	**-**	**CCF4**	**CCF3**	**CCF2**	**CCF1**	**CCF0**

Bit Number	Bit Mnemonic	Description
7	CF	**PCA Counter Overflow flag** Set by hardware when the counter rolls over. CF flags an interrupt if bit ECF in CMOD is set. CF may be set by either hardware or software but can only be cleared by software.
6	CR	**PCA Counter Run control bit** Must be cleared by software to turn the PCA counter off. Set by software to turn the PCA counter on.
5	-	**Reserved** The value read from this bit is indeterminate. Do not set this bit.
4	CCF4	**PCA Module 4 interrupt flag** Must be cleared by software. Set by hardware when a match or capture occurs.
3	CCF3	**PCA Module 3 interrupt flag** Must be cleared by software. Set by hardware when a match or capture occurs.
2	CCF2	**PCA Module 2 interrupt flag** Must be cleared by software. Set by hardware when a match or capture occurs.
1	CCF1	**PCA Module 1 interrupt flag** Must be cleared by software. Set by hardware when a match or capture occurs.
0	CCF0	**PCA Module 0 interrupt flag** Must be cleared by software. Set by hardware when a match or capture occurs.

Reset Value = 00X0 0000b
Bit addressable

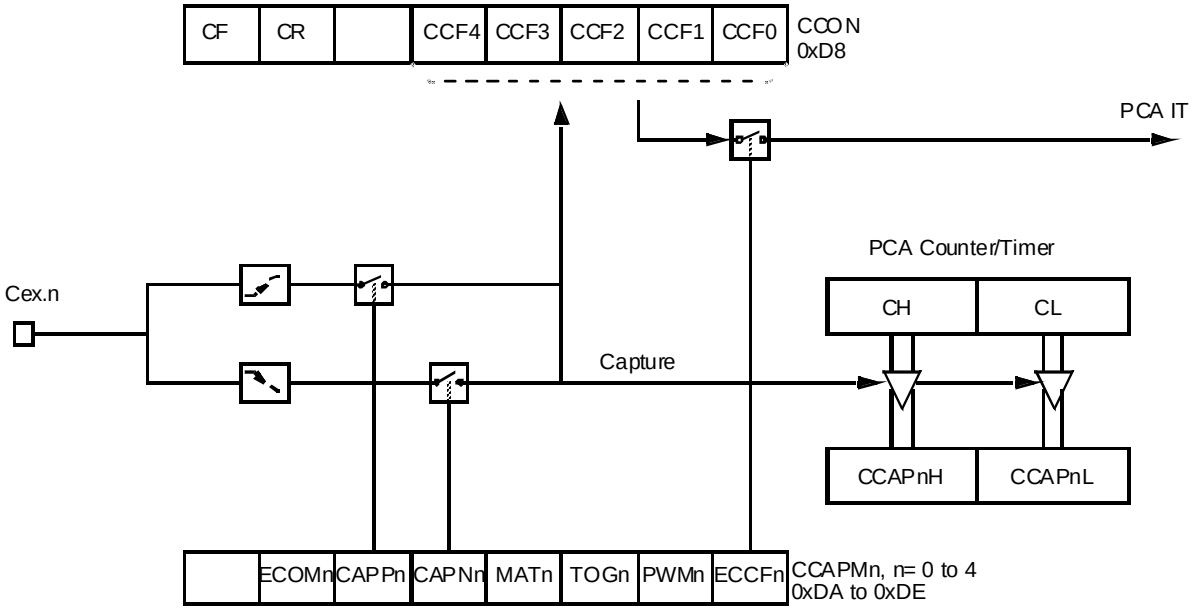
The watchdog timer function is implemented in Module 4 (See Figure 19).

The PCA interrupt system is shown in Figure 17.

PCA Capture Mode

To use one of the PCA modules in the capture mode either one or both of the CCAPM bits CAPN and CAPP for that module must be set. The external CEX input for the module (on port 1) is sampled for a transition. When a valid transition occurs the PCA hardware loads the value of the PCA counter registers (CH and CL) into the module's capture registers (CCAPnL and CCAPnH). If the CCFn bit for the module in the CCON SFR and the ECCFn bit in the CCAPMn SFR are set then an interrupt will be generated (Refer to Figure 18).

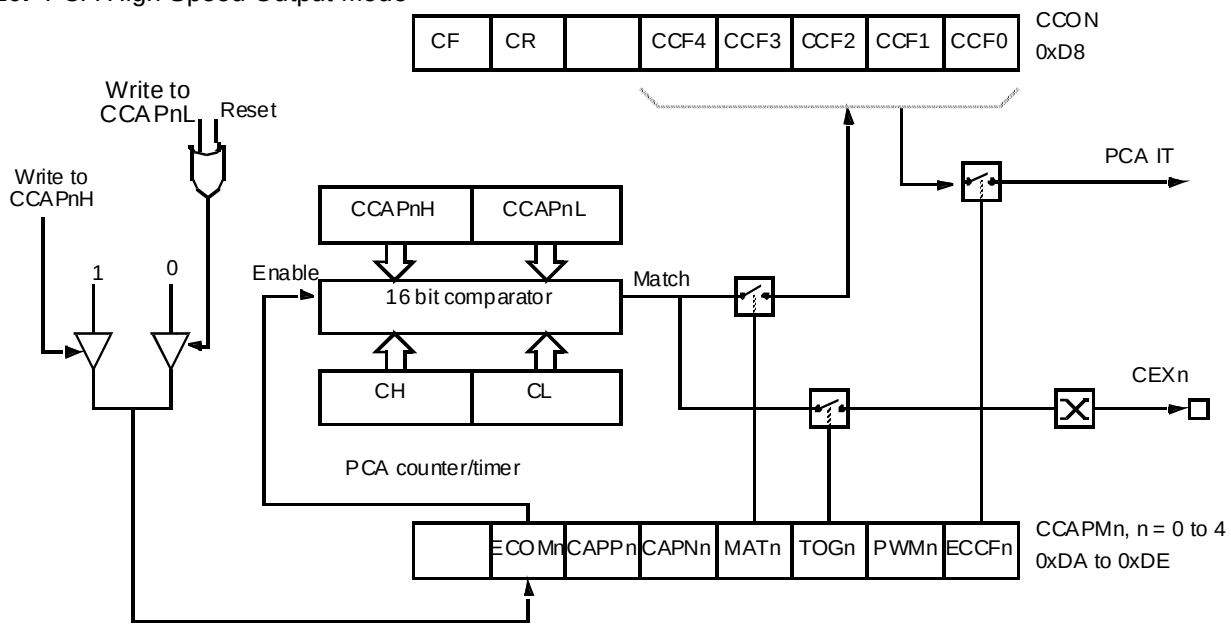
Figure 18. PCA Capture Mode



16-bit Software Timer/ Compare Mode

The PCA modules can be used as software timers by setting both the ECOM and MAT bits in the modules CCAPMn register. The PCA timer will be compared to the module's capture registers and when a match occurs an interrupt will occur if the CCFn (CCON SFR) and the ECCFn (CCAPMn SFR) bits for the module are both set (See Figure 19).

Figure 20. PCA High Speed Output Mode



Before enabling ECOM bit, CCAPnL and CCAPnH should be set with a non zero value, otherwise an unwanted match could happen.

Once ECOM is set, writing CCAPnL will clear ECOM so that an unwanted match doesn't occur while modifying the compare value. Writing to CCAPnH will set ECOM. For this reason, user software should write CCAPnL first, and then CCAPnH. Of course, the ECOM bit can still be controlled by accessing to CCAPMn register.

Pulse Width Modulator Mode

All of the PCA modules can be used as PWM outputs. Figure 21 shows the PWM function. The frequency of the output depends on the source for the PCA timer. All of the modules will have the same frequency of output because they all share the PCA timer. The duty cycle of each module is independently variable using the modules capture register CCAPLn. When the value of the PCA CL SFR is less than the value in the modules CCAPLn SFR the output will be low, when it is equal to or greater than the output will be high. When CL overflows from FF to 00, CCAPLn is reloaded with the value in CCAPHn. This allows updating the PWM without glitches. The PWM and ECOM bits in the module's CCAPMn register must be set to enable the PWM mode.

Table 33. SCON Register

SCON - Serial Control Register (98h)

7	6	5	4	3	2	1	0
FE/SM0	SM1	SM2	REN	TB8	RB8	TI	RI

Bit Number	Bit Mnemonic	Description
7	FE	**Framing Error bit (SMOD0=1**) Clear to reset the error state, not cleared by a valid stop bit. Set by hardware when an invalid stop bit is detected. SMOD0 must be set to enable access to the FE bit.
	SM0	**Serial port Mode bit 0** Refer to SM1 for serial port mode selection. SMOD0 must be cleared to enable access to the SM0 bit.
6	SM1	**Serial port Mode bit 1** SM0 SM1 Mode Baud Rate 0 0 Shift Register F_{XTAL}/12 (or F_{XTAL} /6 in mode X2) 0 1 8-bit UART Variable 1 0 9-bit UART F_{XTAL}/64 or F_{XTAL}/32 1 1 9-bit UART Variable
5	SM2	**Serial port Mode 2 bit / Multiprocessor Communication Enable bit** Clear to disable multiprocessor communication feature. Set to enable multiprocessor communication feature in mode 2 and 3, and eventually mode 1.This bit should be cleared in mode 0.
4	REN	**Reception Enable bit** Clear to disable serial reception. Set to enable serial reception.
3	TB8	**Transmitter Bit 8 / Ninth bit to transmit in modes 2 and 3** Clear to transmit a logic 0 in the 9th bit. Set to transmit a logic 1 in the 9th bit.
2	RB8	**Receiver Bit 8 / Ninth bit received in modes 2 and 3** Cleared by hardware if 9th bit received is a logic 0. Set by hardware if 9th bit received is a logic 1. In mode 1, if SM2 = 0, RB8 is the received stop bit. In mode 0 RB8 is not used.
1	TI	**Transmit Interrupt flag** Clear to acknowledge interrupt. Set by hardware at the end of the 8th bit time in mode 0 or at the beginning of the stop bit in the other modes.
0	RI	**Receive Interrupt flag** Clear to acknowledge interrupt. Set by hardware at the end of the 8th bit time in mode 0, see Figure 23. and Figure 24. in the other modes.

7	6	5	4	3	2	1	0
TF2	EXF2	RCLK	TCLK	EXEN2	TR2	C/T2#	CP/RL2#

Bit Number	Bit Mnemonic	Description
7	TF2	**Timer 2 overflow Flag** Must be cleared by software. Set by hardware on timer 2 overflow, if RCLK = 0 and TCLK = 0.
6	EXF2	**Timer 2 External Flag** Set when a capture or a reload is caused by a negative transition on T2EX pin if EXEN2=1. When set, causes the CPU to vector to timer 2 interrupt routine when timer 2 interrupt is enabled. Must be cleared by software. EXF2 doesn't cause an interrupt in Up/down counter mode (DCEN = 1)
5	RCLK	**Receive Clock bit for UART** Cleared to use timer 1 overflow as receive clock for serial port in mode 1 or 3. Set to use timer 2 overflow as receive clock for serial port in mode 1 or 3.
4	TCLK	**Transmit Clock bit for UART** Cleared to use timer 1 overflow as transmit clock for serial port in mode 1 or 3. Set to use timer 2 overflow as transmit clock for serial port in mode 1 or 3.
3	EXEN2	**Timer 2 External Enable bit** Cleared to ignore events on T2EX pin for timer 2 operation. Set to cause a capture or reload when a negative transition on T2EX pin is detected, if timer 2 is not used to clock the serial port.
2	TR2	**Timer 2 Run control bit** Cleared to turn off timer 2. Set to turn on timer 2.
1	C/T2#	**Timer/Counter 2 select bit** Cleared for timer operation (input from internal clock system: $F_{CLK\ PERIPH}$). Set for counter operation (input from T2 input pin, falling edge trigger). Must be 0 for clock out mode.
0	CP/RL2#	**Timer 2 Capture/Reload bit** If RCLK=1 or TCLK=1, CP/RL2# is ignored and timer is forced to auto-reload on timer 2 overflow. Cleared to auto-reload on timer 2 overflows or negative transitions on T2EX pin if EXEN2=1. Set to capture on negative transitions on T2EX pin if EXEN2=1.

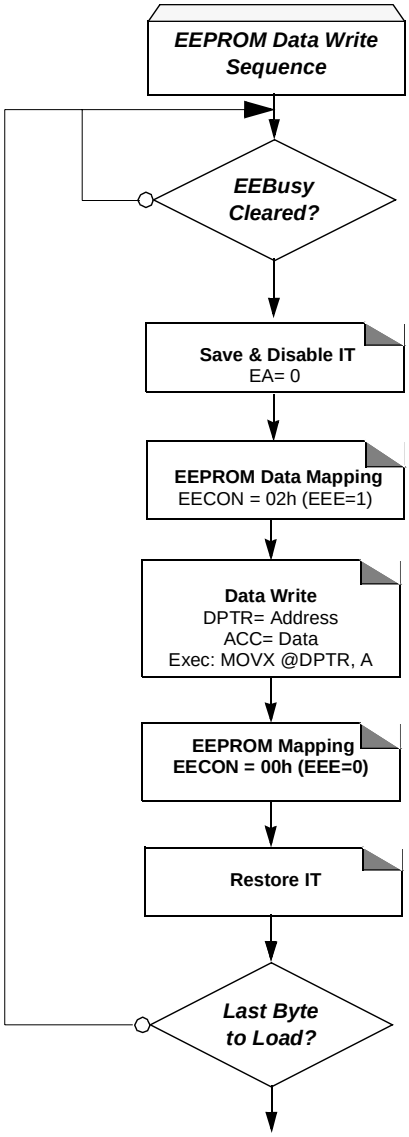
WDT during Power-down and Idle

In Power-down mode the oscillator stops, which means the WDT also stops. While in Power-down mode the user does not need to service the WDT. There are 2 methods of exiting Power-down mode: by a hardware reset or via a level activated external interrupt which is enabled prior to entering Power-down mode. When Power-down is exited with hardware reset, servicing the WDT should occur as it normally should whenever the AT89C51RD2/ED2 is reset. Exiting Power-down with an interrupt is significantly different. The interrupt is held low long enough for the oscillator to stabilize. When the interrupt is brought high, the interrupt is serviced. To prevent the WDT from resetting the device while the interrupt pin is held low, the WDT is not started until the interrupt is pulled high. It is suggested that the WDT be reset during the interrupt service routine.

To ensure that the WDT does not overflow within a few states of exiting of powerdown, it is better to reset the WDT just before entering powerdown.

In the Idle mode, the oscillator continues to run. To prevent the WDT from resetting the AT89C51RD2/ED2 while in Idle mode, the user should always set up a timer that will periodically exit Idle, service the WDT, and re-enter Idle mode.

Figure 38. Recommended EEPROM Data Write Sequence

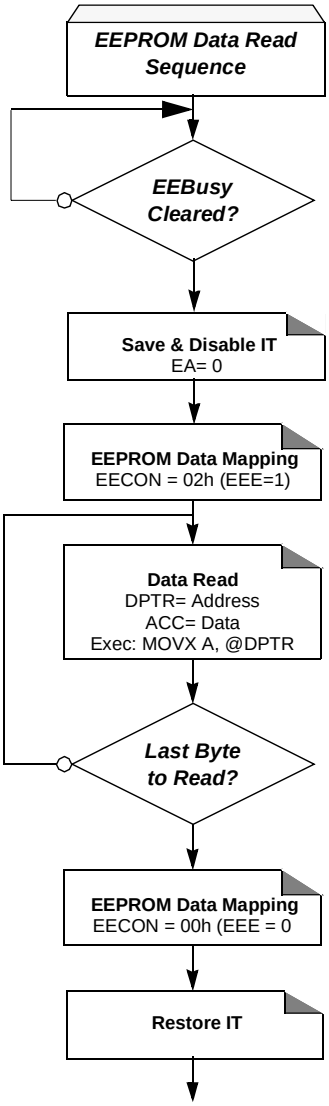


Read Data

The following procedure is used to read the data stored in the EEPROM memory:

- Check EEBUSY flag
- If the user application interrupts routines use XRAM memory space: Save and disable interrupts.
- Load DPTR with the address to read
- Set bit EEE of EECON register
- Execute a MOVX A, @DPTR
- Clear bit EEE of EECON register
- Restore interrupts.

Figure 39. Recommended EEPROM Data Read Sequence



Flash/EEPROM Memory

The Flash memory increases EEPROM and ROM functionality with in-circuit electrical erasure and programming. It contains 64K bytes of program memory organized respectively in 512 pages of 128 bytes. This memory is both parallel and serial In-System Programmable (ISP). ISP allows devices to alter their own program memory in the actual end product under software control. A default serial loader (bootloader) program allows ISP of the Flash.

The programming **does not require** external dedicated programming voltage. The necessary high programming voltage is generated on-chip using the standard V_{CC} pins of the microcontroller.

Features

- Flash EEPROM Internal Program Memory
- Boot vector allows user provided Flash loader code to reside anywhere in the Flash memory space. This configuration provides flexibility to the user.
- Default loader in Boot ROM allows programming via the serial port without the need of a user provided loader.
- Up to 64K bytes external program memory if the internal program memory is disabled (EA = 0).
- Programming and erasing voltage with standard power supply
- Read/Programming/Erase:
  - Byte-wise read without wait state
  - Byte or page erase and programming (10 ms)
- Typical programming time (64K bytes) is 22s with on chip serial bootloader
- Parallel programming with 87C51 compatible hardware interface to programmer
- Programmable security for the code in the Flash
- 100K write cycles
- 10 years data retention

Flash Programming and Erasure

The 64-K byte Flash is programmed by bytes or by pages of 128 bytes. It is not necessary to erase a byte or a page before programming. The programming of a byte or a page includes a self erase before programming.

There are three methods of programming the Flash memory:

1. The on-chip ISP bootloader may be invoked which will use low level routines to program the pages. The interface used for serial downloading of Flash is the UART.
2. The Flash may be programmed or erased in the end-user application by calling low-level routines through a common entry point in the Boot ROM.
3. The Flash may be programmed using the parallel method by using a conventional EPROM programmer. The parallel programming method used by these devices is similar to that used by EPROM 87C51 but it is not identical and the commercially available programmers need to have support for the AT89C51RD2/ED2. The bootloader and the Application Programming Interface (API) routines are located in the BOOT ROM.

Flash Registers and Memory Map

The AT89C51RD2/ED2 Flash memory uses several registers for its management:

- Hardware register can only be accessed through the parallel programming modes which are handled by the parallel programmer.
- Software registers are in a special page of the Flash memory which can be accessed through the API or with the parallel programming modes. This page, called "Extra Flash Memory", is not in the internal Flash program memory addressing space.

Hardware Register

The only hardware register of the AT89C51RD2/ED2 is called Hardware Byte or Hardware Security Byte (HSB).

Table 67. Hardware Security Byte (HSB)

7	6	5	4	3	2	1	0
X2	**BLJB**	**-**	**-**	**XRAM**	**LB2**	**LB1**	**LB0**

Bit Number	Bit Mnemonic	Description
7	X2	**X2 Mode** Programmed (‘0’ value) to force X2 mode (6 clocks per instruction) after reset. Unprogrammed (‘1’ Value) to force X1 mode, Standard Mode, after reset (Default).
6	BLJB	**Boot Loader Jump Bit** Unprogrammed (‘1’ value) to start the user’s application on next reset at address 0000h. Programmed (‘0’ value) to start the boot loader at address F800h on next reset (Default).
5	-	**Reserved**
4	-	**Reserved**
3	XRAM	**XRAM config bit (only programmable by programmer tools)** Programmed to inhibit XRAM. Unprogrammed, this bit to valid XRAM (Default).
2-0	LB2-0	**User Memory Lock Bits (only programmable by programmer tools)** See Table 68

Boot Loader Jump Bit (BLJB)

One bit of the HSB, the BLJB bit, is used to force the boot address:

- When this bit is programmed (‘0’ value) the boot address is F800h.
- When this bit is unprogrammed (‘1’ value) the boot address is 0000h.

By default, this bit is programmed and the ISP is enabled.

Flash Memory Lock Bits

The three lock bits provide different levels of protection for the on-chip code and data when programmed as shown in Table 68.

Table 71. User Memory Lock Bits of the SSB

Program Lock Bits			
Security Level	**LB0**	**LB1**	**Protection Description**
1	1	1	No program lock features enabled.
2	0	1	ISP programming of the Flash is disabled.
3	X	0	Same as 2, also verify through ISP programming interface is disabled.

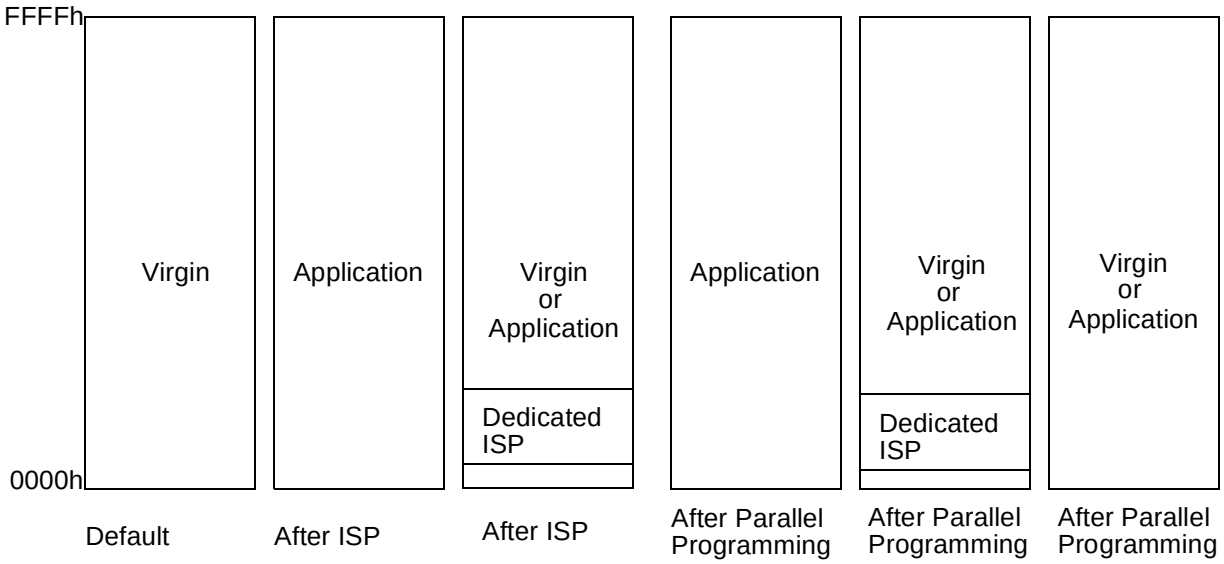
Note: X: Do not care
WARNING: Security level 2 and 3 should only be programmed after Flash verification.

Flash Memory Status

AT89C51RD2/ED2 parts are delivered in standard with the ISP ROM bootloader.

After ISP or parallel programming, the possible contents of the Flash memory are summarized in Figure 40:

Figure 40. Flash Memory Possible Contents



Memory Organization

When the $\overline{EA}$ pin is high, the processor fetches instructions from internal program Flash. If the $\overline{EA}$ pin is tied low, all program memory fetches are from external memory.

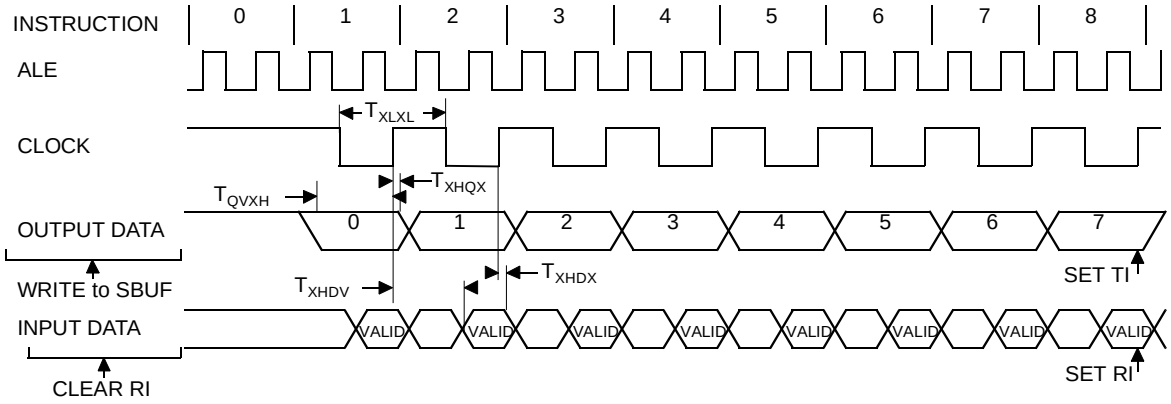
Shift Register Timing Waveforms



External Clock Drive Waveforms

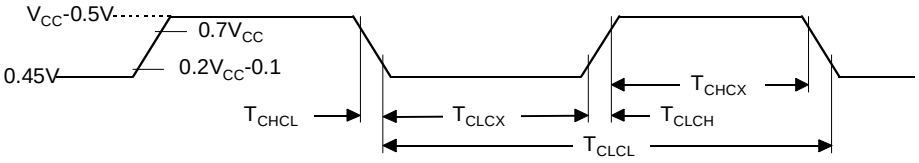


Figure 56. Internal Clock Signals

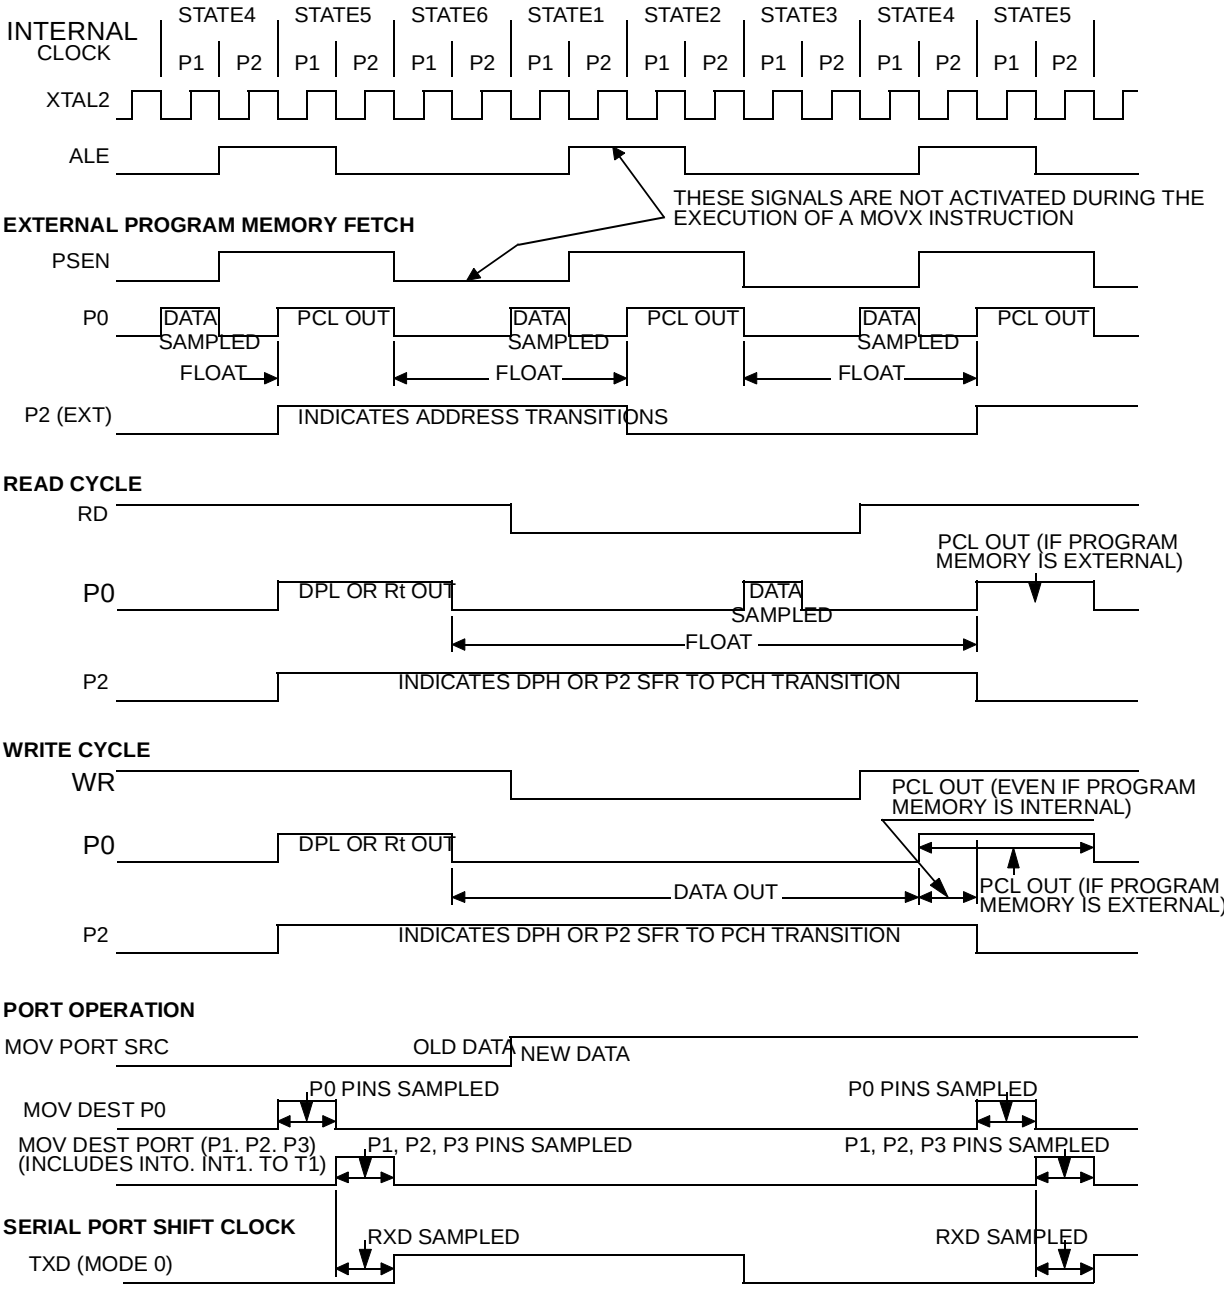

This diagram indicates when signals are clocked internally. The time it takes the signals to propagate to the pins, however, ranges from 25 to 125 ns. This propagation delay is dependent on variables such as temperature and pin loading. Propagation also varies from output to output and component. Typically though (T_A = 25°C fully loaded) $\overline{RD}$ and $\overline{WR}$ propagation delays are approximately 50 ns. The other signals are typically 85 ns. Propagation delays are incorporated in the AC specifications.
