What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Not For New Designs
Core Processor	ARM® Cortex®-M3
Core Size	32-Bit Single-Core
Speed	80MHz
Connectivity	EBI/EMI, I²C, IrDA, SmartCard, SPI, UART/USART
Peripherals	Brown-out Detect/Reset, DMA, I²S, POR, PWM, WDT
Number of I/O	50
Program Memory Size	64KB (64K x 8)
Program Memory Type	FLASH
EEPROM Size	-
RAM Size	16K x 8
Voltage - Supply (Vcc/Vdd)	1.8V ~ 3.6V
Data Converters	A/D 28x12b; D/A 2x10b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 85°C (TA)
Mounting Type	Surface Mount
Package / Case	64-VFQFN Exposed Pad
Supplier Device Package	64-QFN (9x9)

		Operating at 16.4 kHz, T_A = 85 °C	—	—	500	nA

Notes:

1. Perhipheral currents drop to zero when peripheral clock and peripheral are disabled, unless otherwise noted.
2. Currents are additive. For example, where I_{DD} is specified and the mode is not mutually exclusive, enabling the functions increases supply current by the specified amount.
3. Includes all peripherals that cannot have clocks gated in the Clock Control module.
4. Includes supply current from internal regulator and PLL0OSC (>20 MHz) or LPOSC0 (<=20 MHz).
5. Flash execution numbers use 2 wait states for 80 MHz and 0 wait states at 20 MHz or less.
6. RAM execution numbers use 0 wait states for all frequencies.
7. IDAC output current and IVC input current not included.
8. Bias current only. Does not include dynamic current from oscillator running at speed.

3.3. Absolute Maximum Ratings

Stresses above those listed under Table 3.19 may cause permanent damage to the device. This is a stress rating only and functional operation of the devices at those or any other conditions above those indicated in the operation listings of this specification is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

***Note:** VSS and VSSHD provide separate return current paths for device supplies, but are not isolated. They must always be connected to the same potential on board.					

4.1. Power

4.1.1. LDO and Voltage Regulator (VREG0)

The SiM3C1xx devices include two internal regulators: the core LDO Regulator and the Voltage Regulator (VREG0).

The LDO Regulator converts a 1.8–3.6 V supply to the core operating voltage of 1.8 V. This LDO consumes little power and provides flexibility in choosing a power supply for the system.

The Voltage Regulator regulates from 5.5 to 2.7 V and can serve as an input to the LDO. This allows the device to be powered from up to a 5.5 V supply without any external components other than bypass capacitors.

4.1.2. Voltage Supply Monitor (VMON0)

The SiM3C1xx devices include a voltage supply monitor which allows devices to function in known, safe operating condition without the need for external hardware. The supply monitor includes additional circuitry that can monitor the main supply voltage and the VREGIN input voltage divided by 4 (VREGIN / 4).

The supply monitor module includes the following features:

- Main supply “VDD Low” (VDD below the early warning threshold) notification.
- Holds the device in reset if the main VDD supply drops below the VDD Reset threshold.
- VREGIN divided by 4 (VREGIN / 4) supply “VREGIN Low” notification.

4.1.3. External Regulator (EXTVREG0)

The External Regulator provides all the circuitry needed for a high-power regulator except the power transistor (NPN or PNP) and current sensing resistor (if current limiting is enabled).

The External Regulator module has the following features:

- Interfaces with either an NPN or PNP external transistor that serves as the pass device for the high current regulator.
- Automatic current limiting.
- Automatic foldback limiting.
- Sources up to 1 A for use by external circuitry.
- Variable output voltage from 1.8–3.6 V in 100 mV steps.

4.1.4. Power Management Unit (PMU)

The Power Management Unit on the SiM3C1xx manages the power systems of the device. On power-up, the PMU ensures the core voltages are a proper value before core instruction execution begins. It also recognizes and manages the various wake sources for low-power modes of the device.

The PMU module includes the following features:

- Up to 16 pin wake inputs can wake the device from Power Mode 9.
- The Low Power Timer, RTC0 (alarms and oscillator fail), Comparator 0, and the $\overline{\text{RESET}}$ pin can also serve as wake sources for Power Mode 9.
- All PM9 wake sources (except for the $\overline{\text{RESET}}$ pin) can also reset the Low Power Timer or RTC0 modules.
- Disables the level shifters to pins and peripherals to further reduce power usage in PM9. These level shifters must be re-enabed by firmware after exiting PM9.
- Provides a PMU_Asleep signal to a pin as an indicator that the device is in PM9.

4.2. I/O

4.2.1. General Features

The SiM3C1xx ports have the following features:

- Push-pull or open-drain output modes and analog or digital modes.
- Option for high or low output drive strength.
- Port Match allows the device to recognize a change on a port pin value.
- Internal pull-up resistors are enabled or disabled on a port-by-port basis.
- Two external interrupts with up to 16 inputs provide monitoring capability for external signals.
- Internal Pulse Generator Timer (PB2 only) to generate simple square waves.
- A subset of pins can also serve as inputs to the Port Mapped Level Shifters available on the High Drive Pins.

4.2.2. High Drive Pins (PB4)

The High Drive pins have the following additional features:

- Programmable safe state: high, low, or high impedance.
- Programmable drive strength and slew rates.
- Programmable hardware current limiting.
- Powered from a separate source (VIOHD, which can be up to 6 V) from the rest of the device.
- Supports various functions, including GPIO, UART1 pins, EPCA0 pins, or Port Mapped Level Shifting.

4.2.3. 5 V Tolerant Pins (PB3)

The 5 V tolerant pins can be connected to external circuitry operating at voltages above the device supply without needing extra components to shift the voltage level.

4.2.4. Crossbars

The SiM3C1xx devices have two Crossbars with the following features:

- Flexible peripheral assignment to port pins.
- Pins can be individually skipped to move peripherals as needed for design or layout considerations.

The Crossbars have a fixed priority for each I/O function and assign these functions to the port pins. When a digital resource is selected, the least-significant unassigned port pin is assigned to that resource. If a port pin is assigned, the Crossbars skip that pin when assigning the next selected resource. Additionally, the Crossbars will skip port pins whose associated bits in the PBSKIPEN registers are set. This provides some flexibility when designing a system: pins involved with sensitive analog measurements can be moved away from digital I/O and peripherals can be moved around the chip as needed to ease layout constraints.

4.3.1. PLL (PLL0)

The PLL module consists of a dedicated Digitally-Controlled Oscillator (DCO) that can be used in Free-Running mode without a reference frequency, Frequency-Locked to a reference frequency, or Phase-Locked to a reference frequency. The reference frequency for Frequency-Lock and Phase-Lock modes can use one of multiple sources (including the external oscillator) to provide maximum flexibility for different application needs. Because the PLL module generates its own clock, the DCO can be locked to a particular reference frequency and then moved to Free-Running mode to reduce system power and noise.

The PLL module includes the following features:

- Five output ranges with output frequencies ranging from 23 to 80 MHz.
- Multiple reference frequency inputs.
- Three output modes: free-running DCO, frequency-locked, and phase-locked.
- Ability to sense the rising edge or falling edge of the reference source.
- DCO frequency LSB dithering to provide finer average output frequencies.
- Spectrum spreading to reduce generated system noise.
- Low jitter and fast lock times.
- Ability to suspend all output frequency updates (including dithering and spectrum spreading) using the STALL bit during jitter-sensitive operations.

4.3.2. Low Power Oscillator (LPOSC0)

The Low Power Oscillator is the default AHB oscillator on SiM3C1xx devices and enables or disables automatically, as needed.

The Low Power Oscillator has the following features:

- 20 MHz and divided 2.5 MHz frequencies available for the AHB clock.
- Automatically starts and stops as needed.

4.3.3. Low Frequency Oscillator (LFOSC0)

The low frequency oscillator (LFOSC0) provides a low power internal clock source running at approximately 16.4 kHz for the RTC0 timer and other peripherals on the device. No external components are required to use the low frequency oscillator

4.3.4. External Oscillators (EXTOSC0)

The EXTOSC0 external oscillator circuit may drive an external crystal, ceramic resonator, capacitor, or RC network. A CMOS clock may also provide a clock input. The external oscillator output may be selected as the AHB clock or used to clock other modules independent of the AHB clock selection.

The External Oscillator control has the following features:

- Support for external crystal, RC, C, or CMOS oscillators.
- Support external CMOS frequencies from 10 kHz to 50 MHz and external crystal frequencies from 10 kHz to 30 MHz.
- Various drive strengths for flexible crystal oscillator support.
- Internal frequency divide-by-two option available.

4.5. Counters/Timers and PWM

4.5.1. Programmable Counter Array (EPCA0, PCA0, PCA1)

The SiM3C1xx devices include two types of PCA module: Enhanced and Standard.

The Enhanced Programmable Counter Array (EPCA0) and Standard Programmable Counter Array (PCA0, PCA1) modules are timer/counter systems allowing for complex timing or waveform generation. Multiple modules run from the same main counter, allowing for synchronous output waveforms.

The Enhanced PCA module is multi-purpose, but is optimized for motor control applications. The EPCA module includes the following features:

- Three sets of channel pairs (six channels total) capable of generating complementary waveforms.
- Center- and edge-aligned waveform generation.
- Programmable dead times that ensure channel pairs are never both active at the same time.
- Programmable clock divisor and multiple options for clock source selection.
- Waveform update scheduling.
- Option to function while the core is inactive.
- Multiple synchronization triggers and outputs.
- Pulse-Width Modulation (PWM) waveform generation.
- High-speed square wave generation.
- Input capture mode.
- DMA capability for both input capture and waveform generation.
- PWM generation halt input.

The Standard PCA module (PCA) includes the following features:

- Two independent channels.
- Center- and edge-aligned waveform generation.
- Programmable clock divisor and multiple options for clock source selection.
- Pulse-Width Modulation waveform generation.

4.5.2. 32-bit Timer (TIMER0, TIMER1)

Each timer module is independent, and includes the following features:

- Operation as a single 32-bit or two independent 16-bit timers.
- Clocking options include the APB clock, the APB clock scaled using an 8-bit prescaler, the external oscillator, or falling edges on an external input pin (synchronized to the APB clock).
- Auto-reload functionality in both 32-bit and 16-bit modes.
- Up/Down count capability, controlled by an external input pin.
- Rising and falling edge capture modes.
- Low or high pulse capture modes.
- Duty cycle capture mode.
- Square wave output mode, which is capable of toggling an external pin at a given rate with 50% duty cycle.
- 32- or 16-bit pulse-width modulation mode.

4.5.3. Real-Time Clock (RTC0)

The RTC0 module includes a 32-bit timer that allows up to 36 hours of independent time-keeping when used with a 32.768 kHz watch crystal. The RTC0 provides three alarm events in addition to a missing clock event, which can also function as interrupt, reset, or wakeup sources on SiM3C1xx devices.

The RTC0 module includes internal loading capacitors that are programmable to 16 discrete levels, allowing compatibility with a wide range of crystals.

The RTC0 output can be buffered and routed to a port bank pin to provide an accurate, low frequency clock to other devices while the core is in its lowest power down mode. The module also includes a low power internal low frequency oscillator that reduces low power mode current and is available for other modules to use as a clock source.

The RTC module includes the following features:

- 32-bit timer (supports up to 36 hours) with three separate alarms.
- Option for one alarm to automatically reset the RTC timer.
- Missing clock detector.
- Can be used with the internal low frequency oscillator (LFOSC0), an external 32.768 kHz crystal (no additional resistors or capacitors necessary), or with an external CMOS clock.
- Programmable internal loading capacitors support a wide range of external 32.768 kHz crystals.
- Operates directly from VDD and remains operational even when the device goes into its lowest power down mode.
- The RTC timer clock (RTC0TCLK) can be buffered and routed to an I/O pin to provide an accurate, low frequency clock to other devices while the core is in its lowest power down mode.

4.5.4. Low Power Timer (LPTIMER0)

The Low Power Timer (LPTIMER0) module runs from the clock selected by the RTC0 module, allowing the LPTIMER0 to operate even if the AHB and APB clocks are disabled. The LPTIMER0 counter can increment using one of two clock sources: the clock selected by the RTC0 module, or rising or falling edges of an external signal.

The Low Power Timer includes the following features:

- Runs on a low-frequency clock (RTC0TCLK)
- The LPTIMER counter can increment using one of two clock sources: the RTC0TCLK or rising or falling edges of an external signal.
- Overflow and threshold-match detection, which can generate an interrupt, reset the timer, or wake some devices from low power modes.
- Timer reset on threshold-match allows square-wave generation at a variable output frequency.

4.5.5. Watchdog Timer (WDTIMER0)

The WDTIMER0 module includes a 16-bit timer, a programmable early warning interrupt, and a programmable reset period. The timer registers are protected from inadvertent access by an independent lock and key interface.

The watchdog timer runs from the low frequency oscillator (LFOSC0).

The Watchdog Timer has the following features:

- Programmable timeout interval.
- Optional interrupt to warn when the Watchdog Timer is nearing the reset trip value.
- Lock-out feature to prevent any modification until a system reset.

Notes:

1. All dimensions shown are in millimeters (mm) unless otherwise noted.
2. All feature sizes shown are at Maximum Material Condition (MMC) and a card fabrication tolerance of 0.05 mm is assumed.
3. Dimensioning and Tolerancing is per the ANSI Y14.5M-1994 specification.
4. This land pattern design is based on the IPC-7351 guidelines.

7.2. Comparator Rising/Falling Edge Flags in Debug Mode (CMP0, CMP1)

7.2.1. Problem

On Revision A and Revision B devices, if the comparator output is high, the comparator rising and falling edge flags will both be set to 1 upon single-step or exit from debug mode.

7.2.2. Impacts

Firmware using the rising and falling edge flags to make decisions may see a false trigger of the comparator if the output of the comparator is high during a debug session. This does not impact the non-debug operation of the device.

7.2.3. Workaround

There is not a system-agnostic workaround for this issue.

7.2.4. Resolution

This issue exists on Revision A and Revision B devices. It may be corrected in a future device revision.
