What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Not For New Designs
Core Processor	ARM® Cortex®-M3
Core Size	32-Bit Single-Core
Speed	80MHz
Connectivity	I²C, IrDA, SmartCard, SPI, UART/USART
Peripherals	Brown-out Detect/Reset, DMA, I²S, POR, PWM, WDT
Number of I/O	28
Program Memory Size	128KB (128K x 8)
Program Memory Type	FLASH
EEPROM Size	-
RAM Size	32K x 8
Voltage - Supply (Vcc/Vdd)	1.8V ~ 3.6V
Data Converters	A/D 18x12b; D/A 2x10b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 85°C (TA)
Mounting Type	Surface Mount
Package / Case	40-VFQFN Exposed Pad
Supplier Device Package	40-QFN (6x6)

		V_{DD} = 3.0 V, T_A = 25 °C	—	250	—	µA

Notes:
1. Perhipheral currents drop to zero when peripheral clock and peripheral are disabled, unless otherwise noted.
2. Currents are additive. For example, where I_{DD} is specified and the mode is not mutually exclusive, enabling the functions increases supply current by the specified amount.
3. Includes all peripherals that cannot have clocks gated in the Clock Control module.
4. Includes supply current from internal regulator and PLL0OSC (>20 MHz) or LPOSC0 (<=20 MHz).
5. Flash execution numbers use 2 wait states for 80 MHz and 0 wait states at 20 MHz or less.
6. RAM execution numbers use 0 wait states for all frequencies.
7. IDAC output current and IVC input current not included.
8. Bias current only. Does not include dynamic current from oscillator running at speed.

4.1. Power

4.1.1. LDO and Voltage Regulator (VREG0)

The SiM3C1xx devices include two internal regulators: the core LDO Regulator and the Voltage Regulator (VREG0).

The LDO Regulator converts a 1.8–3.6 V supply to the core operating voltage of 1.8 V. This LDO consumes little power and provides flexibility in choosing a power supply for the system.

The Voltage Regulator regulates from 5.5 to 2.7 V and can serve as an input to the LDO. This allows the device to be powered from up to a 5.5 V supply without any external components other than bypass capacitors.

4.1.2. Voltage Supply Monitor (VMON0)

The SiM3C1xx devices include a voltage supply monitor which allows devices to function in known, safe operating condition without the need for external hardware. The supply monitor includes additional circuitry that can monitor the main supply voltage and the VREGIN input voltage divided by 4 (VREGIN / 4).

The supply monitor module includes the following features:

- Main supply “VDD Low” (VDD below the early warning threshold) notification.
- Holds the device in reset if the main VDD supply drops below the VDD Reset threshold.
- VREGIN divided by 4 (VREGIN / 4) supply “VREGIN Low” notification.

4.1.3. External Regulator (EXTVREG0)

The External Regulator provides all the circuitry needed for a high-power regulator except the power transistor (NPN or PNP) and current sensing resistor (if current limiting is enabled).

The External Regulator module has the following features:

- Interfaces with either an NPN or PNP external transistor that serves as the pass device for the high current regulator.
- Automatic current limiting.
- Automatic foldback limiting.
- Sources up to 1 A for use by external circuitry.
- Variable output voltage from 1.8–3.6 V in 100 mV steps.

4.1.4. Power Management Unit (PMU)

The Power Management Unit on the SiM3C1xx manages the power systems of the device. On power-up, the PMU ensures the core voltages are a proper value before core instruction execution begins. It also recognizes and manages the various wake sources for low-power modes of the device.

The PMU module includes the following features:

- Up to 16 pin wake inputs can wake the device from Power Mode 9.
- The Low Power Timer, RTC0 (alarms and oscillator fail), Comparator 0, and the $\overline{\text{RESET}}$ pin can also serve as wake sources for Power Mode 9.
- All PM9 wake sources (except for the $\overline{\text{RESET}}$ pin) can also reset the Low Power Timer or RTC0 modules.
- Disables the level shifters to pins and peripherals to further reduce power usage in PM9. These level shifters must be re-enabed by firmware after exiting PM9.
- Provides a PMU_Asleep signal to a pin as an indicator that the device is in PM9.

4.6. Communications Peripherals

4.6.1. External Memory Interface (EMIF0)

The External Memory Interface (EMIF0) allows external parallel asynchronous devices, like SRAMs and LCD controllers, to appear as part of the system memory map. The EMIF0 module includes the following features:

- Provides a memory mapped view of multiple external devices.
- Support for byte, half-word and word accesses regardless of external device data-width.
- Error indicator for certain invalid transfers.
- Minimum external timing allows for 3 clocks per write or 4 clocks per read.
- Output bus can be shared between non-muxed and muxed devices.
- Available extended address output allows for up to 24-bit address with 8-bit parallel devices.
- Support for 8-bit and 16-bit (muxed-mode only) devices with up to two chip-select signals.
- Support for internally muxed devices with dynamic address shifting.
- Fully programmable control signal waveforms.

4.6.2. USART (USART0, USART1)

The USART uses two signals (TX and RX) and a predetermined fixed baud rate to communicate with a single device. In addition to these signals, the USART0 module can optionally use a clock (UCLK) or hardware handshaking (RTS and CTS).

The USART module provides the following features:

- Independent transmitter and receiver configurations with separate 16-bit baud rate generators.
- Synchronous or asynchronous transmissions and receptions.
- Clock master or slave operation with programmable polarity and edge controls.
- Up to 5 Mbaud (synchronous or asynchronous, TX or RX, and master or slave) or 1 Mbaud Smartcard (TX or RX).
- Individual enables for generated clocks during start, stop, and idle states.
- Internal transmit and receive FIFOs with flush capability and support for byte, half-word, and word reads and writes.
- Data bit lengths from 5 to 9 bits.
- Programmable inter-packet transmit delays.
- Auto-baud detection with support for the LIN SYNC byte.
- Automatic parity generation (with enable).
- Automatic start and stop generation (with separate enables).
- Transmit and receive hardware flow-control.
- Independent inversion correction for TX, RX, RTS, and CTS signals.
- IrDA modulation and demodulation with programmable pulse widths.
- Smartcard ACK/NACK support.
- Parity error, frame error, overrun, and underrun detection.
- Multi-master and half-duplex support.
- Multiple loop-back modes supported.
- Multi-processor communications support.

4.6.3. UART (UART0, UART1)

The USART uses two signals (TX and RX) and a predetermined fixed baud rate to communicate with a single device.

The UART module provides the following features:

- Independent transmitter and receiver configurations with separate 16-bit baud-rate generators.
- Asynchronous transmissions and receptions.
- Up to 5 Mbaud (TX or RX) or 1 Mbaud Smartcard (TX or RX).

4.7. Analog

4.7.1. 12-Bit Analog-to-Digital Converters (SARADC0, SARADC1)

The SARADC0 and SARADC1 modules on SiM3C1xx devices are Successive Approximation Register (SAR) Analog to Digital Converters (ADCs). The key features of the SARADC module are:

- Single-ended 12-bit and 10-bit modes.
- Supports an output update rate of 250 k samples per second in 12-bit mode or 1 M samples per second in 10-bit mode.
- Operation in low power modes at lower conversion speeds.
- Selectable asynchronous hardware conversion trigger with hardware channel select.
- Output data window comparator allows automatic range checking.
- Support for Burst Mode, which produces one set of accumulated data per conversion-start trigger with programmable power-on settling and tracking time.
- Conversion complete, multiple conversion complete, and FIFO overflow and underflow flags and interrupts supported.
- Flexible output data formatting.
- Sequencer allows up to 8 sources to be automatically scanned using one of four channel characteristic profiles without software intervention.
- Eight-word conversion data FIFO for DMA operations.
- Multiple SARADC modules can work together synchronously or by interleaving samples.
- Includes two internal references (1.65 V fast-settling, 1.2/2.4 V precision), support for an external reference, and support for an external signal ground.

4.7.2. Sample Sync Generator (SSG0)

The SSG module includes a phase counter and a pulse generator. The phase counter is a 4-bit free-running counter clocked from the SARADC module clock. Counting-up from zero, the phase counter marks sixteen equally-spaced events for any number of SARADC modules. The ADCs can use this phase counter to start a conversion. The programmable pulse generator creates a 50% duty cycle pulse with a period of 16 phase counter ticks. Up to four programmable outputs available to external devices can be driven by the pulse generator with programmable polarity and a defined output setting when the pulse generator is stopped.

The Sample Sync Generator module has the following features:

- Connects multiple modules together to perform synchronized actions.
- Outputs a clock synchronized to the internal sampling clock used by any number of SARADC modules to pins for use by external devices.
- Includes a phase counter, pulse generator, and up to four programmable outputs.

4.7.3. 10-Bit Digital-to-Analog Converter (IDAC0, IDAC1)

The IDAC takes a digital value as an input and outputs a proportional constant current on a pin. The IDAC module includes the following features:

- 10-bit current DAC with support for four timer, up to seven external I/O, on demand, and SSG0 output update triggers.
- Ability to update on rising, falling, or both edges for any of the external I/O trigger sources (DACnTx).
- Supports an output update rate greater than 600 k samples per second.
- Support for three full-scale output modes: 0.5 mA, 1.0 mA and 2.0 mA.
- Four-word FIFO to aid with high-speed waveform generation or DMA interactions.
- Individual FIFO overrun, underrun, and went-empty interrupt status sources.
- Support for multiple data packing formats, including: single 10-bit sample per word, dual 10-bit samples per word, or four 8-bit samples per word.
- Support for left- and right-justified data.

4.8. Reset Sources

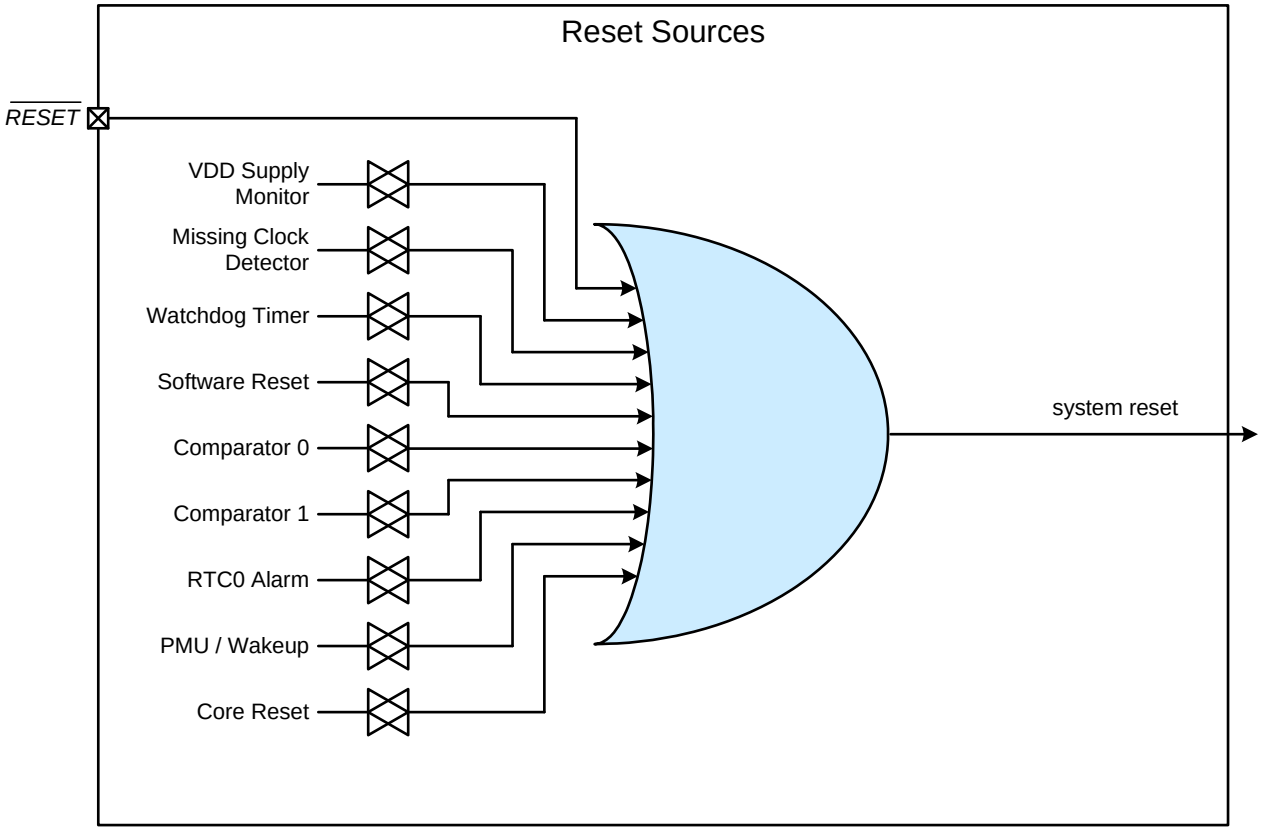
Reset circuitry allows the controller to be easily placed in a predefined default condition. On entry to this reset state, the following occur:

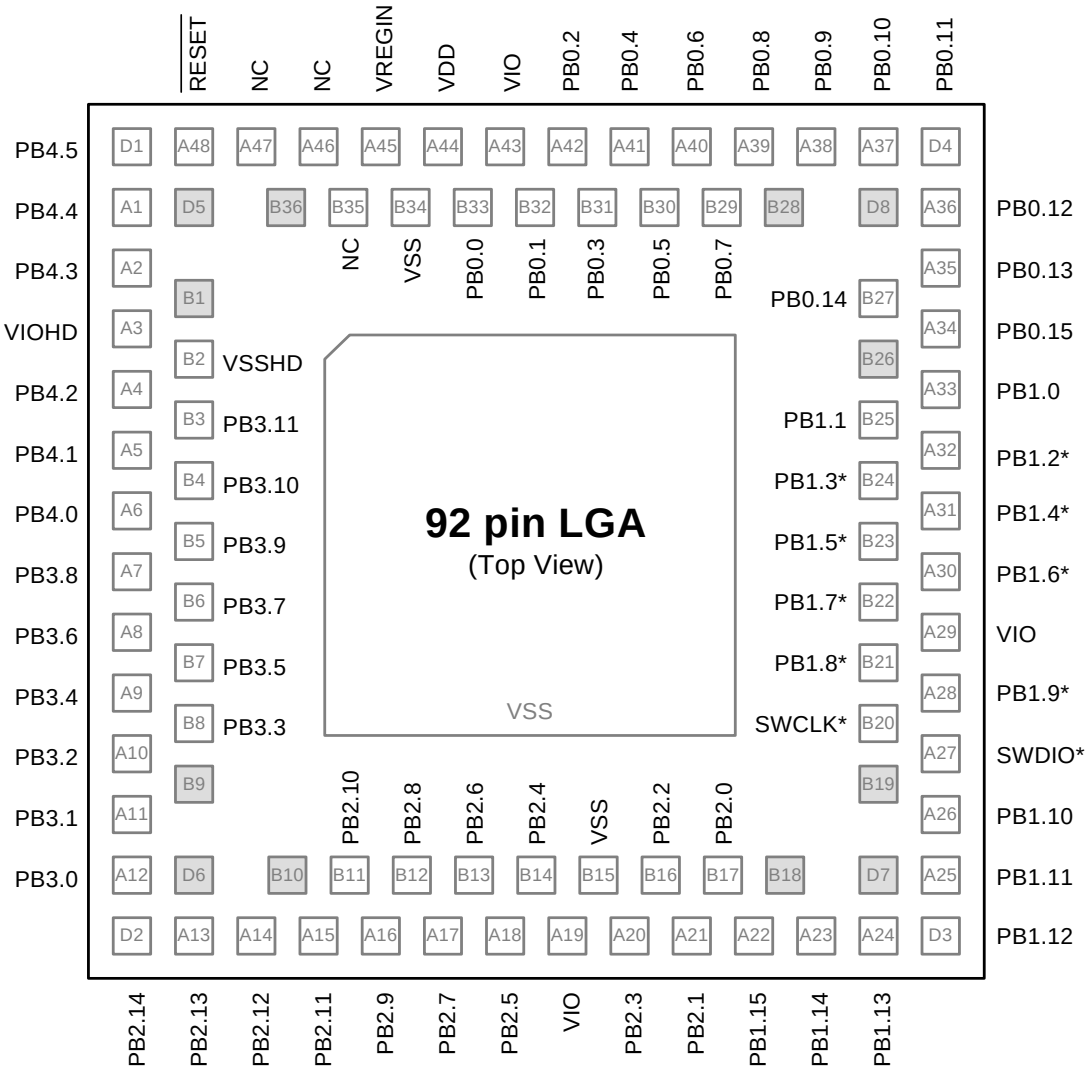
- The core halts program execution.
- Module registers are initialized to their defined reset values unless the bits reset only with a power-on reset.
- External port pins are forced to a known state.
- Interrupts and timers are disabled.
- Clocks to all AHB peripherals are enabled.
- Clocks to all APB peripherals other than Watchdog Timer, EMIF0, and DMAXBAR are disabled.

All registers are reset to the predefined values noted in the register descriptions unless the bits only reset with a power-on reset. The contents of RAM are unaffected during a reset; any previously stored data is preserved as long as power is not lost.

The Port I/O latches are reset to 1 in open-drain mode. Weak pullups are enabled during and after the reset. For VDD Supply Monitor and power-on resets, the $\overline{\text{RESET}}$ pin is driven low until the device exits the reset state.

On exit from the reset state, the program counter (PC) is reset, and the system clock defaults to an internal oscillator. The Watchdog Timer is enabled with the Low Frequency Oscillator (LFO0) as its clock source. Program execution begins at location 0x00000000.





*Noted pins are listed in the pinout table and 80-pin TQFP package figure with additional names. These alternate functions are also present on the 92-pin LGA package and are identical to those on the 80-pin TQFP package.

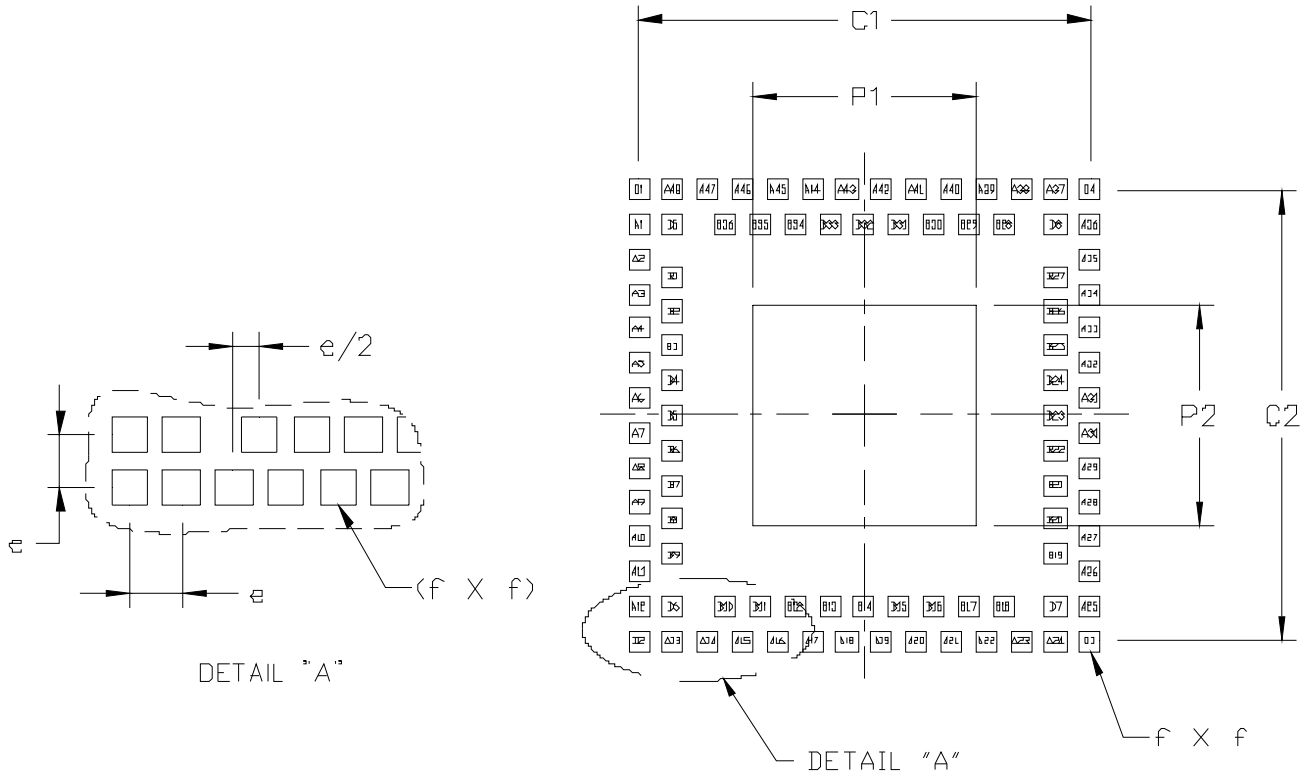

Figure 6.7. LGA-92 Landing Diagram

Table 6.5. LGA-92 Landing Diagram Dimensions

Dimension	Typical	Max
C1	6.50	—
C2	6.50	—
e	0.50	—
f	—	0.35
P1	—	3.20
P2	—	3.20

Notes:

1. All dimensions shown are in millimeters (mm) unless otherwise noted.
2. All feature sizes shown are at Maximum Material Condition (MMC) and a card fabrication tolerance of 0.05 mm is assumed.
3. Dimensioning and Tolerancing is per the ANSI Y14.5M-1994 specification.
4. This land pattern design is based on the IPC-7351 guidelines.

6.4.1. LGA-92 Solder Mask Design

All metal pads are to be non-solder mask defined (NSMD). Clearance between the solder mask and the metal pad is to be 60 µm minimum, all the way around the pad.

6.4.2. LGA-92 Stencil Design

1. A stainless steel, laser-cut and electro-polished stencil with trapezoidal walls should be used to assure good solder paste release.
2. The stencil thickness should be 0.125 mm (5 mils).
3. The ratio of stencil aperture to land pad size should be 1:1 for all perimeter pins.
4. A 2 x 2 array of 1.25 mm square openings on 1.60 mm pitch should be used for the center ground pad.

6.4.3. LGA-92 Card Assembly

1. A No-Clean, Type-3 solder paste is recommended.
2. The recommended card reflow profile is per the JEDEC/IPC J-STD-020 specification for Small Body Components.

Table 6.10. TQFP-64 Package Dimensions (Continued)

Dimension	Min	Nominal	Max
aaa	—	—	0.20
bbb	—	—	0.20
ccc	—	—	0.08
ddd	—	—	0.08

Notes:

1. All dimensions shown are in millimeters (mm) unless otherwise noted.
2. Dimensioning and Tolerancing per ANSI Y14.5M-1994.
3. This package outline conforms to JEDEC MS-026, variant ACD.
4. Recommended card reflow profile is per the JEDEC/IPC J-STD-020 specification for Small Body Components.

Document Change List

Revision 0.8 to Revision 1.0

- Added block diagram to front page; updated feature bullet lists.
- Electrical Specifications Tables Additions:
  - Voltage Regulator Current Sense Supply Current, Typ = 3 µA (Table 3.2)
  - Power Mode 2 Wake Time, Min = 4 clocks, Max = 5 clocks (Table 3.3)
  - External Crystal Clock Frequency, Min = 0.01 MHz, Max = 30 MHz (Table 3.9)
  - Added /RESET pin characteristics (Table 3.17)
- Electrical Specifications Tables Removals:
  - Power Mode 3 Wake Time (Table 3.3)
- Electrical Specifications Tables Corretions/Adjustments:
  - IVC Supply Current, Max = 2.5 µA (Table 3.2)
  - VREG0 Output Voltage Normal Mode, Min = 3.15 V (Table 3.5)
  - VREG0 Output Voltage Suspend Mode, Min = 3.15 V (Table 3.5)
  - External Regulator Internal Pull-Down, Typ = 5 kΩ (Table 3.6)
  - External Regulator Internal Pull-Up, Typ = 10 kΩ (Table 3.6)
  - Flash Memory Endurance, Typ = 100k write/erase cycles (Table 3.7)
  - Flash Memory Retention, Min = 10 Years, Typ = 100 Years (Table 3.7)
  - Low Power Oscillator Frequency, Min = 19.5 MHz, Max = 20.5 MHz (Table 3.8)
  - SAR Dynamic Performance : consolidated all specs. (Table 3.10)
  - IDAC Full Scale Output Current 1 mA Range, Min = 0.99 mA (Table 3.11)
  - IDAC Full Scale Output Current 0.5 mA Range, Min = 493 µA (Table 3.11)
  - IVC Slope @ 1 mA, Min = 1.55 V/mA, Max = 1.75 V/mA (Table 3.13)
  - IVC Slope @ 2 mA, Min = 795 mV/mA, Max = 860 mV/mA (Table 3.13)
  - IVC Slope @ 3 mA, Min = 525 mV/mA, Max = 570 mV/mA (Table 3.13)
  - IVC Slope @ 4 mA, Min = 390 mV/mA, Max = 430 mV/mA (Table 3.13)
  - IVC Slope @ 5 mA, Min = 315 mV/mA (Table 3.13)
  - IVC Slope @ 6 mA, Min = 260 mV/mA (Table 3.13)
  - Temperature Sensor Slope Error, Type = ±120 µV/C (Table 3.15)
  - Comparator Input Offset Voltage, Min = –10 mV, Max = 10 mV (Table 3.16)
- “4. Precision32™ SiM3C1xx System Overview” :
  - Updated Power Modes discussion.
  - Refined and updated feature bullet lists.
- Updated and clarified RTC timer clock output. The RTC output is now referred to as "RTC0TCLK".
- “6. Pin Definitions and Packaging Information” : Renamed RTC0OSC_OUT function to RTC0TCLK_OUT for consistency.
- “7. Revision Specific Behavior” : Updated revision identification drawings to better match physical appearance of packages.
