

Welcome to E-XFL.COM

What is "[Embedded - Microcontrollers](#)"?

"[Embedded - Microcontrollers](#)" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "[Embedded - Microcontrollers](#)"

Details

- WDT enabled at POR

General Description

The ZGP323H is an OTP-based member of the MCU family of infrared microcontrollers. With 237B of general-purpose RAM and up to 32KB of OTP, ZiLOG®'s CMOS microcontrollers offer fast-executing, efficient use of memory, sophisticated interrupts, input/output bit manipulation capabilities, automated pulse generation/reception, and internal key-scan pull-up transistors.

The ZGP323H architecture (Figure 1) is based on ZiLOG's 8-bit microcontroller core with an Expanded Register File allowing access to register-mapped peripherals, input/output (I/O) circuits, and powerful counter/timer circuitry. The Z8® offers a flexible I/O scheme, an efficient register and address space structure, and a number of ancillary features that are useful in many consumer, automotive, computer peripheral, and battery-operated hand-held applications.

There are three basic address spaces available to support a wide range of configurations: Program Memory, Register File and Expanded Register File. The register file is composed of 256 Bytes (B) of RAM. It includes 4 I/O port registers, 16 control and status registers, and 236 general-purpose registers. The Expanded Register File consists of two additional register groups (F and D).

To unburden the program from coping with such real-time problems as generating complex waveforms or receiving and demodulating complex waveform/pulses, the Z8 GP OTP offers a new intelligent counter/timer architecture with 8-bit and 16-bit counter/timers (see Figure 2). Also included are a large number of user-selectable modes and two on-board comparators to process analog signals with separate reference voltages.

► **Note:** All signals with an overline, " $\overline{}$ ", are active Low. For example, $\overline{B/W}$, in which WORD is active Low, and $\overline{B/W}$, in which BYTE is active Low.

Power connections use the conventional descriptions listed in Table 3.

Table 3. Power Connections

| Connection | Circuit | Device |
|------------|-----------------|-----------------|
| Power | V _{CC} | V _{DD} |
| Ground | GND | V _{SS} |

Note: Refer to the specific package for available pins.

| | | 3.6V | | 0.8 | 2.0 | mA | V _{IN} = 0V, Clock at 8.0MHz | 1, 2, 6 |
| | | 5.5V | | 1.3 | 3.2 | mA | V _{IN} = 0V, Clock at 8.0MHz | 1, 2, 6 |
| I _{CC2} | Standby Current (Stop Mode) | 2.0V | | 1.6 | 12 | μA | V _{IN} = 0 V, V _{CC} WDT not Running | 3 |
| | | 3.6V | | 1.8 | 15 | μA | V _{IN} = 0 V, V _{CC} WDT not Running | 3 |
| | | 5.5V | | 1.9 | 18 | μA | V _{IN} = 0 V, V _{CC} WDT not Running | 3 |
| | | 2.0V | | 5 | 30 | μA | V _{IN} = 0 V, V _{CC} WDT is Running | 3 |
| | | 3.6V | | 8 | 40 | μA | V _{IN} = 0 V, V _{CC} WDT is Running | 3 |
| | | 5.5V | | 15 | 60 | μA | V _{IN} = 0 V, V _{CC} WDT is Running | 3 |
| I _{LV} | Standby Current (Low Voltage) | | | 1.2 | 6 | μA | Measured at 1.3V | 4 |
| V _{BO} | V _{CC} Low Voltage Protection | | | 1.9 | 2.15 | V | 8MHz maximum Ext. CLK Freq. | |
| V _{LVD} | V _{CC} Low Voltage Detection | | | 2.4 | | V | | |
| V _{HVD} | V _{CC} High Voltage Detection | | | 2.7 | | V | | |

Notes:

1. All outputs unloaded, inputs at rail.
2. CL1 = CL2 = 100 pF.
3. Oscillator stopped.
4. Oscillator stops when V_{CC} falls below V_{BO} limit.
5. It is strongly recommended to add a filter capacitor (minimum 0.1 μF), physically close to V_{CC} and V_{SS} pins if operating voltage fluctuations are anticipated, such as those resulting from driving an Infrared LED.
6. Comparator and Timers are on. Interrupt disabled.
7. Typical values shown are at 25 degrees C.

Pin Functions

XTAL1 Crystal 1 (Time-Based Input)

This pin connects a parallel-resonant crystal or ceramic resonator to the on-chip oscillator input. Additionally, an optional external single-phase clock can be coded to the on-chip oscillator input.

XTAL2 Crystal 2 (Time-Based Output)

This pin connects a parallel-resonant crystal or ceramic resonator to the on-chip oscillator output.

Port 0 (P07–P00)

Port 0 is an 8-bit, bidirectional, CMOS-compatible port. These eight I/O lines are configured under software control as a nibble I/O port. The output drivers are push-pull or open-drain controlled by bit D2 in the PCON register.

If one or both nibbles are needed for I/O operation, they must be configured by writing to the Port 0 mode register. After a hardware reset, Port 0 is configured as an input port.

An optional pull-up transistor is available as a mask option on all Port 0 bits with nibble select.

- **Notes:** Internal pull-ups are disabled on any given pin or group of port pins when programmed into output mode.

The Port 0 direction is reset to its default state following an SMR.

CTR1(0D)01H" on page 35). Other edge detect and IRQ modes are described in Table 14.

- **Note:** Comparators are powered down by entering Stop Mode. For P31–P33 to be used in a Stop Mode Recovery (SMR) source, these inputs must be placed into digital mode.

Table 14. Port 3 Pin Function Summary

| Pin | I/O | Counter/Timers | Comparator | Interrupt |
|-----------|-----|----------------|------------|-----------|
| Pref1/P30 | IN | | RF1 | |
| P31 | IN | IN | AN1 | IRQ2 |
| P32 | IN | | AN2 | IRQ0 |
| P33 | IN | | RF2 | IRQ1 |
| P34 | OUT | T8 | AO1 | |
| P35 | OUT | T16 | | |
| P36 | OUT | T8/16 | | |
| P37 | OUT | | AO2 | |
| P20 | I/O | IN | | |

Port 3 also provides output for each of the counter/timers and the AND/OR Logic (see Figure 13). Control is performed by programming bits D5–D4 of CTR1, bit 0 of CTR0, and bit 0 of CTR2.

Capture_INT_Mask

Set this bit to allow an interrupt when data is captured into either LO8 or HI8 upon a positive or negative edge detection in demodulation mode.

Counter_INT_Mask

Set this bit to allow an interrupt when T8 has a timeout.

P34_Out

This bit defines whether P34 is used as a normal output pin or the T8 output.

T8 and T16 Common Functions—CTR1(0D)01H

This register controls the functions in common with the T8 and T16.

Table 16 lists and briefly describes the fields for this register.

Table 16. CTR1(0D)01H T8 and T16 Common Functions

| Field | Bit Position | | Value | Description |
|-------------------------------|--------------|-----|-------|-------------------|
| Mode | 7----- | R/W | 0* | Transmit Mode |
| | | | | Demodulation Mode |
| P36_Out/ Demodulator_Input | -6----- | R/W | 0* | Transmit Mode |
| | | | 1 | Port Output |
| | | | | T8/T16 Output |
| | | | 0* | Demodulation Mode |
| | | | 1 | P31 |
| | | | | P20 |
| T8/T16_Logic/ Edge_Detect | --54---- | R/W | | Transmit Mode |
| | | | 00** | AND |
| | | | 01 | OR |
| | | | 10 | NOR |
| | | | 11 | NAND |
| | | | | Demodulation Mode |
| | | | 00** | Falling Edge |
| | | | 01 | Rising Edge |
| | | | 10 | Both Edges |
| | | | 11 | Reserved |

Caution:

Do not load these registers at the time the values are to be loaded into the counter/timer to ensure known operation. An initial count of 1 is not allowed. An initial count of 0 causes T16 to count from 0 to FFFFH to FFFE_H. Transition from 0 to FFFF_H is not a timeout condition.

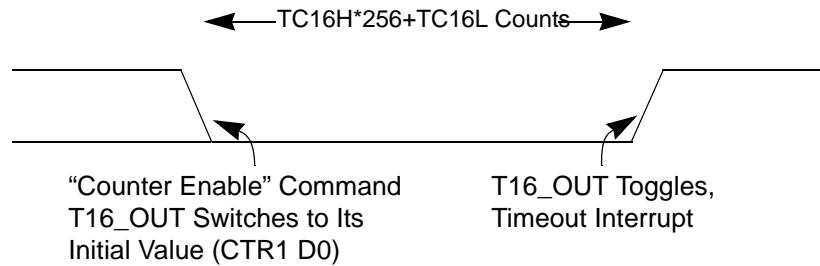

Figure 26. T16_OUT in Single-Pass Mode

Figure 27. T16_OUT in Modulo-N Mode

T16 DEMODULATION Mode

The user must program TC16L and TC16H to FF_H. After T16 is enabled, and the first edge (rising, falling, or both depending on CTR1 D5; D4) is detected, T16 captures HI16 and LO16, reloads, and begins counting.

If D6 of CTR2 Is 0

When a subsequent edge (rising, falling, or both depending on CTR1, D5; D4) is detected during counting, the current count in T16 is complemented and put into HI16 and LO16. When data is captured, one of the edge detect status bits (CTR1, D1; D0) is set, and an interrupt is generated if enabled (CTR2, D2). T16 is loaded with FFFF_H and starts again.

This T16 mode is generally used to measure space time, the length of time between bursts of carrier signal (marks).

If D6 of CTR2 Is 1

T16 ignores the subsequent edges in the input signal and continues counting down. A timeout of T8 causes T16 to capture its current value and generate an interrupt if enabled (CTR2, D2). In this case, T16 does not reload and continues counting. If the D6 bit of CTR2 is toggled (by writing a 0 then a 1 to it), T16 captures and reloads on the next edge (rising, falling, or both depending on CTR1, D5; D4), continuing to ignore subsequent edges.

This T16 mode generally measures mark time, the length of an active carrier signal burst.

If T16 reaches 0, T16 continues counting from `FFFFh`. Meanwhile, a status bit (CTR2 D5) is set, and an interrupt timeout can be generated if enabled (CTR2 D1).

Ping-Pong Mode

This operation mode is only valid in TRANSMIT Mode. T8 and T16 must be programmed in Single-Pass mode (CTR0, D6; CTR2, D6), and Ping-Pong mode must be programmed in CTR1, D3; D2. The user can begin the operation by enabling either T8 or T16 (CTR0, D7 or CTR2, D7). For example, if T8 is enabled, T8_OUT is set to this initial value (CTR1, D1). According to T8_OUT's level, TC8H or TC8L is loaded into T8. After the terminal count is reached, T8 is disabled, and T16 is enabled. T16_OUT then switches to its initial value (CTR1, D0), data from TC16H and TC16L is loaded, and T16 starts to count. After T16 reaches the terminal count, it stops, T8 is enabled again, repeating the entire cycle. Interrupts can be allowed when T8 or T16 reaches terminal control (CTR0, D1; CTR2, D1). To stop the ping-pong operation, write 00 to bits D3 and D2 of CTR1. See Figure 28.

- **Note:** Enabling ping-pong operation while the counter/timers are running might cause intermittent counter/timer function. Disable the counter/timers and reset the status flags before instituting this operation.

Port 0 Output Mode (D2)

Bit 2 controls the output mode of port 0. A 1 in this location sets the output to push-pull, and a 0 sets the output to open-drain.

Stop-Mode Recovery Register (SMR)

This register selects the clock divide value and determines the mode of Stop Mode Recovery (Figure 33). All bits are write only except bit 7, which is read only. Bit 7 is a flag bit that is hardware set on the condition of Stop recovery and reset by a power-on cycle. Bit 6 controls whether a low level or a high level at the XOR-gate input (Figure 35 on page 59) is required from the recovery source. Bit 5 controls the reset delay after recovery. Bits D2, D3, and D4 of the SMR register specify the source of the Stop Mode Recovery signal. Bits D0 determines if SCLK/TCLK are divided by 16 or not. The SMR is located in Bank F of the Expanded Register Group at address 0BH.
