

Welcome to [E-XFL.COM](http://E-XFL.COM)

### What is "[Embedded - Microcontrollers](#)"?

"[Embedded - Microcontrollers](#)" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

### Applications of "[Embedded - Microcontrollers](#)"

#### Details

Product Status	Obsolete
Core Processor	Z8
Core Size	8-Bit
Speed	8MHz
Connectivity	-
Peripherals	HLVD, POR, WDT
Number of I/O	24
Program Memory Size	32KB (32K x 8)
Program Memory Type	OTP
EEPROM Size	-
RAM Size	237 x 8
Voltage - Supply (Vcc/Vdd)	2V ~ 5.5V
Data Converters	-
Oscillator Type	Internal
Operating Temperature	0°C ~ 70°C (TA)
Mounting Type	Through Hole
Package / Case	28-DIP (0.600", 15.24mm)
Supplier Device Package	-
Purchase URL	<a href="https://www.e-xfl.com/product-detail/zilog/zgp323hsp2832c">https://www.e-xfl.com/product-detail/zilog/zgp323hsp2832c</a>

V <sub>LVD</sub>	V <sub>CC</sub> Low Voltage Detection			2.4		V		
V <sub>HVD</sub>	V <sub>CC</sub> High Voltage Detection			2.7		V		

**Notes:**

1. All outputs unloaded, inputs at rail.
2. CL1 = CL2 = 100 pF.
3. Oscillator stopped.
4. Oscillator stops when V<sub>CC</sub> falls below V<sub>BO</sub> limit.
5. It is strongly recommended to add a filter capacitor (minimum 0.1 μF), physically close to V<sub>CC</sub> and V<sub>SS</sub> pins if operating voltage fluctuations are anticipated, such as those resulting from driving an Infrared LED.
6. Comparator and Timers are on. Interrupt disabled.
7. Typical values shown are at 25 degrees C.

**Table 11. GP323HA DC Characteristics (Continued)**

Symbol	Parameter	V <sub>CC</sub>	T <sub>A</sub> = -40°C to +125°C			Units	Conditions	Notes
			Min	Typ(7)	Max			
V <sub>HVD</sub>	V <sub>CC</sub> High Voltage Detection			2.7		V		

**Notes:**

1. All outputs unloaded, inputs at rail.
2. CL1 = CL2 = 100 pF.
3. Oscillator stopped.
4. Oscillator stops when V<sub>CC</sub> falls below V<sub>BO</sub> limit.
5. It is strongly recommended to add a filter capacitor (minimum 0.1 μF), physically close to V<sub>CC</sub> and V<sub>SS</sub> pins if operating voltage fluctuations are anticipated, such as those resulting from driving an Infrared LED.
6. Comparator and Timers are on. Interrupt disabled.
7. Typical values shown are at 25 degrees C.

**Table 12. EPROM/OTP Characteristics**

Symbol	Parameter	Min.	Typ.	Max.	Unit	Notes
	Erase Time	15			Minutes	1,3
	Data Retention @ use years		10		Years	2
	Program/Erase Endurance	100			Cycles	1

**Notes:**

1. For windowed cerdip package only.
2. Standard: 0°C to 70°C; Extended: -40°C to +105°C; Automotive: -40°C to +125°C. Determined using the Arrhenius model, which is an industry standard for estimating data retention of floating gate technologies:

$$AF = \exp[(E_a/k) * (1/T_{use} - 1/T_{stress})]$$

Where:

E<sub>a</sub> is the intrinsic activation energy (eV; typ. 0.8)

k is Boltzman's constant (8.67 x 10<sup>-5</sup> eV/°K)

°K = -273.16°C

T<sub>use</sub> = Use Temperature in °K

T<sub>stress</sub> = Stress Temperature in °K

3. At a stable UV Lamp output of 20mW/CM<sup>2</sup>

Figure 14. Program Memory Map (32K OTP)

## Expanded Register File

The register file has been expanded to allow for additional system control registers and for mapping of additional peripheral devices into the register address area. The Z8<sup>®</sup> register address space (R0 through R15) has been implemented as 16 banks, with 16 registers per bank. These register groups are known as the

### **T8/T16\_Logic/Edge \_Detect**

In TRANSMIT Mode, this field defines how the outputs of T8 and T16 are combined (AND, OR, NOR, NAND).

In DEMODULATION Mode, this field defines which edge should be detected by the edge detector.

### **Transmit\_Submode/Glitch Filter**

In Transmit Mode, this field defines whether T8 and T16 are in the PING-PONG mode or in independent normal operation mode. Setting this field to “NORMAL OPERATION Mode” terminates the “PING-PONG Mode” operation. When set to 10, T16 is immediately forced to a 0; a setting of 11 forces T16 to output a 1.

In DEMODULATION Mode, this field defines the width of the glitch that must be filtered out.

### **Initial\_T8\_Out/Rising\_Edge**

In TRANSMIT Mode, if 0, the output of T8 is set to 0 when it starts to count. If 1, the output of T8 is set to 1 when it starts to count. When the counter is not enabled and this bit is set to 1 or 0, T8\_OUT is set to the opposite state of this bit. This ensures that when the clock is enabled, a transition occurs to the initial state set by CTR1, D1.

In DEMODULATION Mode, this bit is set to 1 when a rising edge is detected in the input signal. In order to reset the mode, a 1 should be written to this location.

### **Initial\_T16 Out/Falling \_Edge**

In TRANSMIT Mode, if it is 0, the output of T16 is set to 0 when it starts to count. If it is 1, the output of T16 is set to 1 when it starts to count. This bit is effective only in Normal or PING-PONG Mode (CTR1, D3; D2). When the counter is not enabled and this bit is set, T16\_OUT is set to the opposite state of this bit. This ensures that when the clock is enabled, a transition occurs to the initial state set by CTR1, D0.

In DEMODULATION Mode, this bit is set to 1 when a falling edge is detected in the input signal. In order to reset it, a 1 should be written to this location.

- **Note:** Modifying CTR1 (D1 or D0) while the counters are enabled causes unpredictable output from T8/T16\_OUT.

### **CTR2 Counter/Timer 16 Control Register—CTR2(D)02H**

Table 17 lists and briefly describes the fields for this register.

Figure 19. Transmit Mode Flowchart

into LO8; if it is a negative edge, data is put into HI8. From that point, one of the edge detect status bits (CTR1, D1; D0) is set, and an interrupt can be generated if enabled (CTR0, D2). Meanwhile, T8 is loaded with FFh and starts counting again. If T8 reaches 0, the timeout status bit (CTR0, D5) is set, and an interrupt can be generated if enabled (CTR0, D1). T8 then continues counting from FFh (see Figure 23 and Figure 24).

Figure 23. Demodulation Mode Count Capture Flowchart

### T16 Transmit Mode

In NORMAL or PING-PONG mode, the output of T16 when not enabled, is dependent on CTR1, D0. If it is a 0, T16\_OUT is a 1; if it is a 1, T16\_OUT is 0. You can force the output of T16 to either a 0 or 1 whether it is enabled or not by programming CTR1 D3; D2 to a 10 or 11.

When T16 is enabled, TC16H \* 256 + TC16L is loaded, and T16\_OUT is switched to its initial value (CTR1, D0). When T16 counts down to 0, T16\_OUT is toggled (in NORMAL or PING-PONG mode), an interrupt (CTR2, D1) is generated (if enabled), and a status bit (CTR2, D5) is set. See Figure 25.

**Figure 25. 16-Bit Counter/Timer Circuits**

► **Note:** Global interrupts override this function as described in “Interrupts” on page 50.

If T16 is in SINGLE-PASS mode, it is stopped at this point (see Figure 26). If it is in Modulo-N Mode, it is loaded with TC16H \* 256 + TC16L, and the counting continues (see Figure 27).

You can modify the values in TC16H and TC16L at any time. The new values take effect when they are loaded.

**Figure 28. Ping-Pong Mode Diagram**

### Initiating PING-PONG Mode

First, make sure both counter/timers are not running. Set T8 into Single-Pass mode (CTR0, D6), set T16 into SINGLE-PASS mode (CTR2, D6), and set the Ping-Pong mode (CTR1, D2; D3). These instructions can be in random order. Finally, start PING-PONG mode by enabling either T8 (CTR0, D7) or T16 (CTR2, D7). See Figure 29.

**Figure 29. Output Circuit**

The initial value of T8 or T16 must not be 1. Stopping the timer and restarting the timer reloads the initial value to avoid an unknown previous value.

Figure 34. SCLK Circuit

### Stop-Mode Recovery Source (D2, D3, and D4)

These three bits of the SMR specify the wake-up source of the Stop recovery (Figure 35 and Table 22).

### Stop-Mode Recovery Register 2—SMR2(F)0DH

Table 21 lists and briefly describes the fields for this register.

Table 21. SMR2(F)0DH:Stop Mode Recovery Register 2\*

Field	Bit Position	Value	Description
Reserved	7-----	0	Reserved (Must be 0)
Recovery Level	-6-----	W 0 <sup>†</sup> 1	Low High
Reserved	--5-----	0	Reserved (Must be 0)
Source	---432--	W 000 <sup>†</sup> 001 010 011 100 101 110 111	A. POR Only B. NAND of P23–P20 C. NAND of P27–P20 D. NOR of P33–P31 E. NAND of P33–P31 F. NOR of P33–P31, P00, P07 G. NAND of P33–P31, P00, P07 H. NAND of P33–P31, P22–P20
Reserved	-----10	00	Reserved (Must be 0)

**Notes:**

\* Port pins configured as outputs are ignored as a SMR recovery source.
