Welcome to E-XFL.COM

Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

Details	
Product Status	Obsolete
Number of LABs/CLBs	1176
Number of Logic Elements/Cells	5292
Total RAM Bits	57344
Number of I/O	166
Number of Gates	236666
Voltage - Supply	2.375V ~ 2.625V
Mounting Type	Surface Mount
Operating Temperature	0°C ~ 85°C (TJ)
Package / Case	240-BFQFP
Supplier Device Package	240-PQFP (32x32)
Purchase URL	https://www.e-xfl.com/product-detail/xilinx/xcv200-6pq240c

more I/O pins convert to V_{REF} pins. Since these are always a superset of the V_{REF} pins used for smaller devices, it is possible to design a PCB that permits migration to a larger device if necessary. All the V_{REF} pins for the largest device anticipated must be connected to the V_{REF} voltage, and not used for I/O.

In smaller devices, some V_{CCO} pins used in larger devices do not connect within the package. These unconnected pins can be left unconnected externally, or can be connected to the V_{CCO} voltage to permit migration to a larger device if necessary.

In TQ144 and PQ/HQ240 packages, all V_{CCO} pins are bonded together internally, and consequently the same V_{CCO} voltage must be connected to all of them. In the CS144 package, bank pairs that share a side are interconnected internally, permitting four choices for V_{CCO}. In both cases, the V_{REF} pins remain internally connected as eight banks, and can be used as described previously.

Configurable Logic Block

The basic building block of the Virtex CLB is the logic cell (LC). An LC includes a 4-input function generator, carry logic, and a storage element. The output from the function generator in each LC drives both the CLB output and the D input of the flip-flop. Each Virtex CLB contains four LCs, organized in two similar slices, as shown in Figure 4.

Figure 5 shows a more detailed view of a single slice.

In addition to the four basic LCs, the Virtex CLB contains logic that combines function generators to provide functions of five or six inputs. Consequently, when estimating the number of system gates provided by a given device, each CLB counts as 4.5 LCs.

Look-Up Tables

Virtex function generators are implemented as 4-input look-up tables (LUTs). In addition to operating as a function generator, each LUT can provide a 16 x 1-bit synchronous RAM. Furthermore, the two LUTs within a slice can be combined to create a 16 x 2-bit or 32 x 1-bit synchronous RAM, or a 16x1-bit dual-port synchronous RAM.

The Virtex LUT can also provide a 16-bit shift register that is ideal for capturing high-speed or burst-mode data. This mode can also be used to store data in applications such as Digital Signal Processing.

Storage Elements

The storage elements in the Virtex slice can be configured either as edge-triggered D-type flip-flops or as level-sensitive latches. The D inputs can be driven either by the function generators within the slice or directly from slice inputs, bypassing the function generators.

In addition to Clock and Clock Enable signals, each Slice has synchronous set and reset signals (SR and BY). SR forces a storage element into the initialization state specified for it in the configuration. BY forces it into the opposite state. Alternatively, these signals can be configured to operate asynchronously. All of the control signals are independently invertible, and are shared by the two flip-flops within the slice.

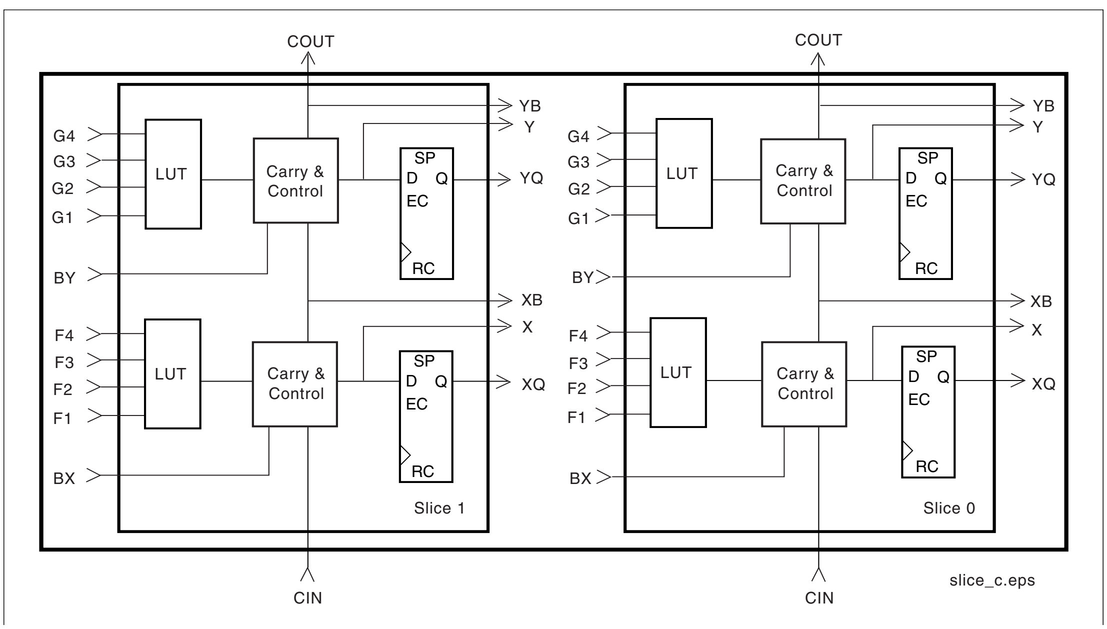

Figure 4: **2-Slice Virtex CLB**

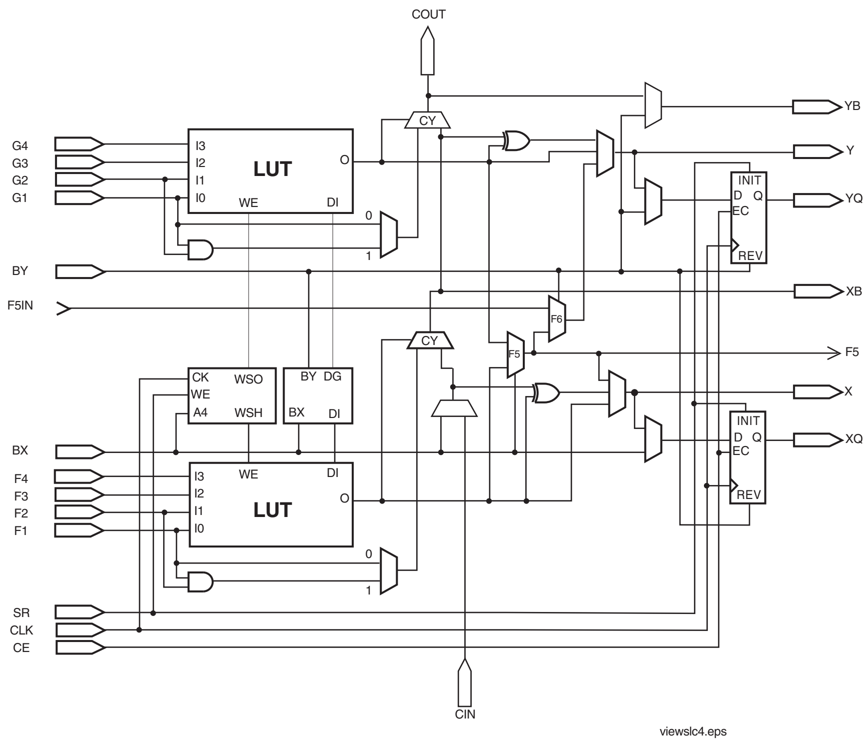

Figure 5: **Detailed View of Virtex Slice**

Additional Logic

The F5 multiplexer in each slice combines the function generator outputs. This combination provides either a function generator that can implement any 5-input function, a 4:1 multiplexer, or selected functions of up to nine inputs.

Similarly, the F6 multiplexer combines the outputs of all four function generators in the CLB by selecting one of the F5-multiplexer outputs. This permits the implementation of any 6-input function, an 8:1 multiplexer, or selected functions of up to 19 inputs.

Each CLB has four direct feedthrough paths, one per LC. These paths provide extra data input lines or additional local routing that does not consume logic resources.

Arithmetic Logic

Dedicated carry logic provides fast arithmetic carry capability for high-speed arithmetic functions. The Virtex CLB supports two separate carry chains, one per Slice. The height of the carry chains is two bits per CLB.

The arithmetic logic includes an XOR gate that allows a 1-bit full adder to be implemented within an LC. In addition, a dedicated AND gate improves the efficiency of multiplier implementation.

The dedicated carry path can also be used to cascade function generators for implementing wide logic functions.

BUFTs

Each Virtex CLB contains two 3-state drivers (BUFTs) that can drive on-chip busses. See **Dedicated Routing**, page 7. Each Virtex BUFT has an independent 3-state control pin and an independent input pin.

Block SelectRAM

Virtex FPGAs incorporate several large block SelectRAM memories. These complement the distributed LUT SelectRAMs that provide shallow RAM structures implemented in CLBs.

Block SelectRAM memory blocks are organized in columns. All Virtex devices contain two such columns, one along each vertical edge. These columns extend the full height of the chip. Each memory block is four CLBs high, and consequently, a Virtex device 64 CLBs high contains 16 memory blocks per column, and a total of 32 blocks.

Table 3 shows the amount of block SelectRAM memory that is available in each Virtex device.

Table 3: **Virtex Block SelectRAM Amounts**

Device	# of Blocks	Total Block SelectRAM Bits
XCV50	8	32,768
XCV100	10	40,960
XCV150	12	49,152
XCV200	14	57,344
XCV300	16	65,536
XCV400	20	81,920
XCV600	24	98,304
XCV800	28	114,688
XCV1000	32	131,072

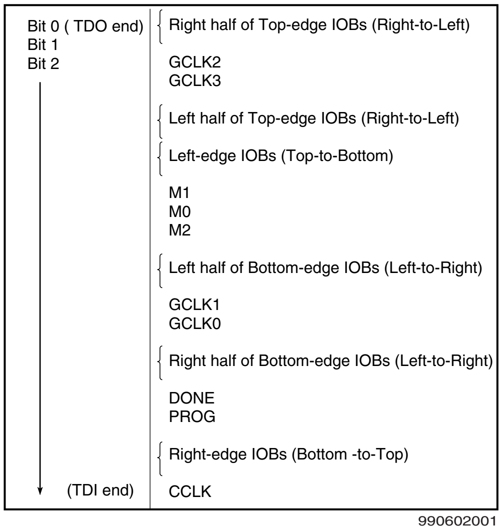

Figure 11: **Boundary Scan Bit Sequence**

Table 5: **Boundary Scan Instructions**

Boundary-Scan Command	Binary Code(4:0)	Description
EXTEST	00000	Enables boundary-scan EXTEST operation
SAMPLE/PRELOAD	00001	Enables boundary-scan SAMPLE/PRELOAD operation
USER 1	00010	Access user-defined register 1
USER 2	00011	Access user-defined register 2
CFG_OUT	00100	Access the configuration bus for read operations.
CFG_IN	00101	Access the configuration bus for write operations.
INTEST	00111	Enables boundary-scan INTEST operation
USERCODE	01000	Enables shifting out USER code
IDCODE	01001	Enables shifting out of ID Code
HIGHZ	01010	3-states output pins while enabling the Bypass Register
JSTART	01100	Clock the start-up sequence when StartupClk is TCK
BYPASS	11111	Enables BYPASS
RESERVED	All other codes	Xilinx reserved instructions

Identification Registers

The IDCODE register is supported. By using the IDCODE, the device connected to the JTAG port can be determined.

The IDCODE register has the following binary format:

vvvv:ffff:fffa:aaaa:aaaa:cccc:cccc:ccc1

where

v = the die version number

f = the family code (03h for Virtex family)

a = the number of CLB rows (ranges from 010h for XCV50 to 040h for XCV1000)

c = the company code (49h for Xilinx)

The USERCODE register is supported. By using the USERCODE, a user-programmable identification code can be loaded and shifted out for examination. The identification code is embedded in the bitstream during bitstream generation and is valid only after configuration.

Table 6: **IDCODEs Assigned to Virtex FPGAs**

FPGA	IDCODE
XCV50	v0610093h
XCV100	v0614093h
XCV150	v0618093h
XCV200	v061C093h
XCV300	v0620093h
XCV400	v0628093h
XCV600	v0630093h
XCV800	v0638093h
XCV1000	v0640093h

Including Boundary Scan in a Design

Since the boundary scan pins are dedicated, no special element needs to be added to the design unless an internal data register (USER1 or USER2) is desired.

If an internal data register is used, insert the boundary scan symbol and connect the necessary pins as appropriate.

Development System

Virtex FPGAs are supported by the Xilinx Foundation and Alliance CAE tools. The basic methodology for Virtex design consists of three interrelated steps: design entry, implementation, and verification. Industry-standard tools are used for design entry and simulation (for example, Synopsys FPGA Express), while Xilinx provides proprietary architecture-specific tools for implementation.

The Xilinx development system is integrated under the Xilinx Design Manager (XDM™) software, providing design-

Configuration

Virtex devices are configured by loading configuration data into the internal configuration memory. Some of the pins used for this are dedicated configuration pins, while others can be re-used as general purpose inputs and outputs once configuration is complete.

The following are dedicated pins:

- Mode pins (M2, M1, M0)
- Configuration clock pin (CCLK)
- PROGRAM pin
- DONE pin
- Boundary-scan pins (TDI, TDO, TMS, TCK)

Depending on the configuration mode chosen, CCLK can be an output generated by the FPGA, or it can be generated externally and provided to the FPGA as an input. The PROGRAM pin must be pulled High prior to reconfiguration.

Note that some configuration pins can act as outputs. For correct operation, these pins can require a V_{CCO} of 3.3 V to permit LVTTL operation. All the pins affected are in banks 2 or 3. The configuration pins needed for SelectMap (CS, Write) are located in bank 1.

After Virtex devices are configured, unused IOBs function as 3-state OBUFTs with weak pull downs. For a more detailed description than that given below, see the XAPP138, Virtex Configuration and Readback.

Configuration Modes

Virtex supports the following four configuration modes.

- Slave-serial mode
- Master-serial mode
- SelectMAP mode
- Boundary-scan mode

The Configuration mode pins (M2, M1, M0) select among these configuration modes with the option in each case of having the IOB pins either pulled up or left floating prior to configuration. The selection codes are listed in Table 7.

Configuration through the boundary-scan port is always available, independent of the mode selection. Selecting the boundary-scan mode simply turns off the other modes. The three mode pins have internal pull-up resistors, and default to a logic High if left unconnected. However, it is recommended to drive the configuration mode pins externally.

Table 7: **Configuration Codes**

Configuration Mode	M2	M1	M0	CCLK Direction	Data Width	Serial D_{out}	Configuration Pull-ups
Master-serial mode	0	0	0	Out	1	Yes	No
Boundary-scan mode	1	0	1	N/A	1	No	No
SelectMAP mode	1	1	0	In	8	No	No
Slave-serial mode	1	1	1	In	1	Yes	No
Master-serial mode	1	0	0	Out	1	Yes	Yes
Boundary-scan mode	0	0	1	N/A	1	No	Yes
SelectMAP mode	0	1	0	In	8	No	Yes
Slave-serial mode	0	1	1	In	1	Yes	Yes

Slave-Serial Mode

In slave-serial mode, the FPGA receives configuration data in bit-serial form from a serial PROM or other source of serial configuration data. The serial bitstream must be setup at the DIN input pin a short time before each rising edge of an externally generated CCLK.

For more information on serial PROMs, see the PROM data sheet at:
http://www.xilinx.com/bvdocs/publications/ds026.pdf.

Multiple FPGAs can be daisy-chained for configuration from a single source. After a particular FPGA has been configured, the data for the next device is routed to the DOUT pin. The data on the DOUT pin changes on the rising edge of CCLK.

The change of DOUT on the rising edge of CCLK differs from previous families, but does not cause a problem for mixed configuration chains. This change was made to improve serial configuration rates for Virtex-only chains.

Figure 12 shows a full master/slave system. A Virtex device in slave-serial mode should be connected as shown in the third device from the left.

Slave-serial mode is selected by applying <111> or <011> to the mode pins (M2, M1, M0). A weak pull-up on the mode pins makes slave-serial the default mode if the pins are left unconnected. However, it is recommended to drive the configuration mode pins externally. Figure 13 shows slave-serial mode programming switching characteristics.

Table 8 provides more detail about the characteristics shown in Figure 13. Configuration must be delayed until the INIT pins of all daisy-chained FPGAs are High.

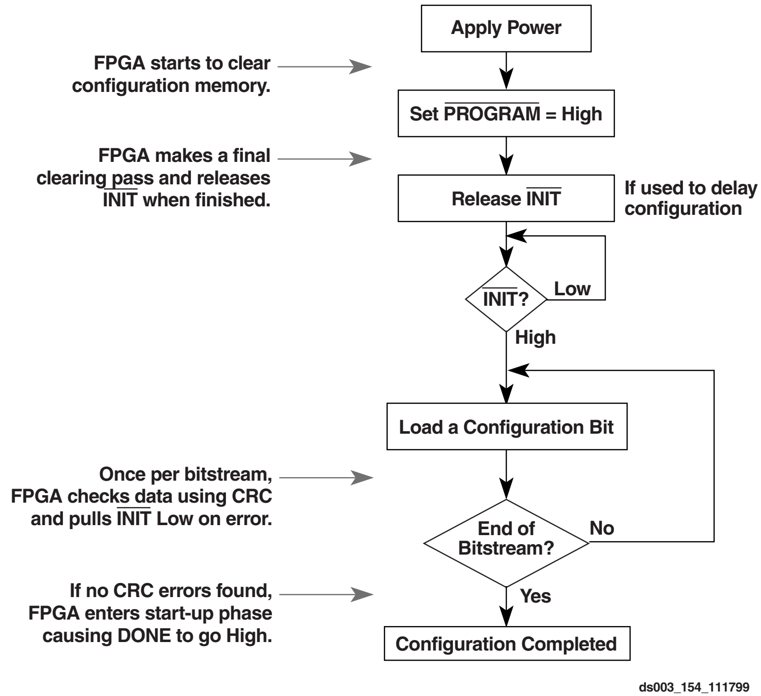

Figure 15: **Serial Configuration Flowchart**

After configuration, the pins of the SelectMAP port can be used as additional user I/O. Alternatively, the port can be retained to permit high-speed 8-bit readback.

Retention of the SelectMAP port is selectable on a design-by-design basis when the bitstream is generated. If retention is selected, PROHIBIT constraints are required to prevent the SelectMAP-port pins from being used as user I/O.

Multiple Virtex FPGAs can be configured using the SelectMAP mode, and be made to start-up simultaneously. To configure multiple devices in this way, wire the individual CCLK, Data, WRITE, and BUSY pins of all the devices in parallel. The individual devices are loaded separately by asserting the CS pin of each device in turn and writing the appropriate data. see Table 9 for SelectMAP Write Timing Characteristics.

Table 9: **SelectMAP Write Timing Characteristics**

	Description		Symbol		Units
CCLK	D_{0-7} Setup/Hold	1/2	T_{SMDCC}/T_{SMCCD}	5.0 / 1.7	ns, min
	CS Setup/Hold	3/4	T_{SMCSCC}/T_{SMCCCS}	7.0 / 1.7	ns, min
	WRITE Setup/Hold	5/6	T_{SMCCW}/T_{SMWCC}	7.0 / 1.7	ns, min
	BUSY Propagation Delay	7	T_{SMCKBY}	12.0	ns, max
	Maximum Frequency		F_{CC}	66	MHz, max
	Maximum Frequency with no handshake		F_{CCNH}	50	MHz, max

Write

Write operations send packets of configuration data into the FPGA. The sequence of operations for a multi-cycle write operation is shown below. Note that a configuration packet can be split into many such sequences. The packet does not have to complete within one assertion of CS, illustrated in Figure 16.

1. Assert WRITE and CS Low. Note that when CS is asserted on successive CCLKs, WRITE must remain either asserted or de-asserted. Otherwise an abort will be initiated, as described below.
2. Drive data onto D[7:0]. Note that to avoid contention, the data source should not be enabled while CS is Low and WRITE is High. Similarly, while WRITE is High, no more that one CS should be asserted.

Date	Version	Revision
01/00	1.9	Updated DLL Jitter Parameter table and waveforms, added Delay Measurement Methodology table for different I/O standards, changed buffered Hex line info and Input/Output Timing measurement notes.
03/00	2.0	New TBCKO values; corrected FG680 package connection drawing; new note about status of CCLK pin after configuration.
05/00	2.1	Modified "Pins not listed..." statement. Speed grade update to Final status.
05/00	2.2	Modified Table 18.
09/00	2.3	• Added XCV400 values to table under **Minimum Clock-to-Out for Virtex Devices**. • Corrected Units column in table under **IOB Input Switching Characteristics**. • Added values to table under **CLB SelectRAM Switching Characteristics**.
10/00	2.4	• Corrected Pinout information for devices in the BG256, BG432, and BG560 packages in Table 18. • Corrected **BG256 Pin Function Diagram**.
04/01	2.5	• Revised minimums for **Global Clock Set-Up and Hold for LVTTL Standard, with DLL**. • Updated SelectMAP Write Timing Characteristics values in Table 9. • Converted file to modularized format. See the **Virtex Data Sheet** section.
07/19/01	2.6	• Made minor edits to text under **Configuration**.
07/19/02	2.7	• Made minor edit to Figure 16 and Figure 18.
09/10/02	2.8	• Added clarifications in the **Configuration**, **Boundary-Scan Mode**, and **Block SelectRAM** sections. Revised Figure 17.
12/09/02	2.8.1	• Added clarification in the **Boundary Scan** section. • Corrected number of buffered Hex lines listed in **General Purpose Routing** section.
03/01/13	4.0	The products listed in this data sheet are obsolete. See **XCN10016** for further information.

Virtex Data Sheet

The Virtex Data Sheet contains the following modules:

- DS003-1, Virtex 2.5V FPGAs:
  Introduction and Ordering Information (Module 1)
- DS003-2, Virtex 2.5V FPGAs:
  Functional Description (Module 2)

  DC and Switching Characteristics (Module 3)
- DS003-4, Virtex 2.5V FPGAs:
  Pinout Tables (Module 4)

Virtex™ 2.5 V Field Programmable Gate Arrays

DS003-3 (v4.0) March 1, 2013

Production Product Specification

Virtex Electrical Characteristics

Definition of Terms

Electrical and switching characteristics are specified on a per-speed-grade basis and can be designated as Advance, Preliminary, or Production. Each designation is defined as follows:

Advance: These speed files are based on simulations only and are typically available soon after device design specifications are frozen. Although speed grades with this designation are considered relatively stable and conservative, some under-reporting might still occur.

Preliminary: These speed files are based on complete ES (engineering sample) silicon characterization. Devices and speed grades with this designation are intended to give a better indication of the expected performance of production silicon. The probability of under-reporting delays is greatly reduced as compared to Advance data.

Production: These speed files are released once enough production silicon of a particular device family member has been characterized to provide full correlation between speed files and devices over numerous production lots. There is no under-reporting of delays, and customers receive formal notification of any subsequent changes. Typically, the slowest speed grades transition to Production before faster speed grades.

All specifications are representative of worst-case supply voltage and junction temperature conditions. The parameters included are common to popular designs and typical applications. Contact the factory for design considerations requiring more detailed information.

Table 1 correlates the current status of each Virtex device with a corresponding speed file designation.

Table 1: **Virtex Device Speed Grade Designations**

Device	Speed Grade Designations		
	Advance	Preliminary	Production
XCV50			–6, –5, –4
XCV100			–6, –5, –4
XCV150			–6, –5, –4
XCV200			–6, –5, –4
XCV300			–6, –5, –4
XCV400			–6, –5, –4
XCV600			–6, –5, –4
XCV800			–6, –5, –4
XCV1000			–6, –5, –4

All specifications are subject to change without notice.

IOB Input Switching Characteristics Standard Adjustments

Description	Symbol	Standard(1)	Speed Grade				Units
			Min	-6	-5	-4	
Data Input Delay Adjustments							
Standard-specific data input delay adjustments	T_{ILVTTL}	LVTTL	0	0	0	0	ns
	$T_{ILVCMOS2}$	LVCMOS2	–0.02	–0.04	–0.04	–0.05	ns
	T_{IPCI33_3}	PCI, 33 MHz, 3.3 V	–0.05	–0.11	–0.12	–0.14	ns
	T_{IPCI33_5}	PCI, 33 MHz, 5.0 V	0.13	0.25	0.28	0.33	ns
	T_{IPCI66_3}	PCI, 66 MHz, 3.3 V	–0.05	–0.11	–0.12	–0.14	ns

	T_{ISSTL2}	SSTL2	–0.04	–0.08	–0.09	–0.10	ns
	T_{ISSTL3}	SSTL3	–0.02	–0.04	–0.05	–0.06	ns
	T_{ICTT}	CTT	0.01	0.02	0.02	0.02	ns
	T_{IAGP}	AGP	–0.03	–0.06	–0.07	–0.08	ns

Notes:
1. Input timing for LVTTL is measured at 1.4 V. For other I/O standards, see Table 3.

IOB Output Switching Characteristics

Output delays terminating at a pad are specified for LVTTL with 12 mA drive and fast slew rate. For other standards, adjust the delays with the values shown in **IOB Output Switching Characteristics Standard Adjustments**, page 9.

Description	Symbol	Speed Grade				Units
		Min	-6	-5	-4	
Propagation Delays						
O input to Pad	T_{IOOP}	1.2	2.9	3.2	3.5	ns, max
O input to Pad via transparent latch	T_{IOOLP}	1.4	3.4	3.7	4.0	ns, max
3-State Delays						
T input to Pad high-impedance(1)	T_{IOTHZ}	1.0	2.0	2.2	2.4	ns, max
T input to valid data on Pad	T_{IOTON}	1.4	3.1	3.3	3.7	ns, max
T input to Pad high-impedance via transparent latch(1)	$T_{IOTLPHZ}$	1.2	2.4	2.6	3.0	ns, max
T input to valid data on Pad via transparent latch	$T_{IOTLPON}$	1.6	3.5	3.8	4.2	ns, max
GTS to Pad high impedance(1)	T_{GTS}	2.5	4.9	5.5	6.3	ns, max
Sequential Delays						
Clock CLK						
Minimum Pulse Width, High	T_{CH}	0.8	1.5	1.7	2.0	ns, min
Minimum Pulse Width, Low	T_{CL}	0.8	1.5	1.7	2.0	ns, min

IOB Output Switching Characteristics Standard Adjustments

Output delays terminating at a pad are specified for LVTTL with 12 mA drive and fast slew rate. For other standards, adjust the delays by the values shown.

Description	Symbol	Standard[1]	Speed Grade				Units
			Min	-6	-5	-4	
Output Delay Adjustments							
Standard-specific adjustments for output delays terminating at pads (based on standard capacitive load, Csl)	T_{OLVTTL_S2}	LVTTL, Slow, 2 mA	4.2	14.7	15.8	17.0	ns
	T_{OLVTTL_S4}	4 mA	2.5	7.5	8.0	8.6	ns
	T_{OLVTTL_S6}	6 mA	1.8	4.8	5.1	5.6	ns
	T_{OLVTTL_S8}	8 mA	1.2	3.0	3.3	3.5	ns
	T_{OLVTTL_S12}	12 mA	1.0	1.9	2.1	2.2	ns
	T_{OLVTTL_S16}	16 mA	0.9	1.7	1.9	2.0	ns
	T_{OLVTTL_S24}	24 mA	0.8	1.3	1.4	1.6	ns
	T_{OLVTTL_F2}	LVTTL, Fast, 2mA	1.9	13.1	14.0	15.1	ns
	T_{OLVTTL_F4}	4 mA	0.7	5.3	5.7	6.1	ns
	T_{OLVTTL_F6}	6 mA	0.2	3.1	3.3	3.6	ns
	T_{OLVTTL_F8}	8 mA	0.1	1.0	1.1	1.2	ns
	T_{OLVTTL_F12}	12 mA	0	0	0	0	ns
	T_{OLVTTL_F16}	16 mA	–0.10	–0.05	–0.05	–0.05	ns
	T_{OLVTTL_F24}	24 mA	–0.10	–0.20	–0.21	–0.23	ns
	$T_{OLVCMOS2}$	LVCMOS2	0.10	0.10	0.11	0.12	ns
	T_{OPCI33_3}	PCI, 33 MHz, 3.3 V	0.50	2.3	2.5	2.7	ns
	T_{OPCI33_5}	PCI, 33 MHz, 5.0 V	0.40	2.8	3.0	3.3	ns
	T_{OPCI66_3}	PCI, 66 MHz, 3.3 V	0.10	–0.40	–0.42	–0.46	ns
	T_{OGTL}	GTL	0.6	0.50	0.54	0.6	ns
	T_{OGTLP}	GTL+	0.7	0.8	0.9	1.0	ns
	T_{OHSTL_I}	HSTL I	0.10	–0.50	–0.53	–0.5	ns
	T_{OHSTL_III}	HSTL III	–0.10	–0.9	–0.9	–1.0	ns
	T_{OHSTL_IV}	HSTL IV	–0.20	–1.0	–1.0	–1.1	ns
	T_{OSSTL2_I}	SSTL2 I	–0.10	–0.50	–0.53	–0.5	ns
	T_{OSSLT2_II}	SSTL2 II	–0.20	–0.9	–0.9	–1.0	ns
	T_{OSSTL3_I}	SSTL3 I	–0.20	–0.50	–0.53	–0.5	ns
	T_{OSSTL3_II}	SSTL3 II	–0.30	–1.0	–1.0	–1.1	ns
	T_{OCTT}	CTT	0	–0.6	–0.6	–0.6	ns
	T_{OAGP}	AGP	0	–0.9	–0.9	–1.0	ns

Notes:

1. Output timing is measured at 1.4 V with 35 pF external capacitive load for LVTTL. For other I/O standards and different loads, see Table 2 and Table 3.

Block RAM Switching Characteristics

Description	Symbol	Speed Grade				Units
		Min	-6	-5	-4	
Sequential Delays						
Clock CLK to DOUT output	T_{BCKO}	1.7	3.4	3.8	4.3	ns, max
Setup and Hold Times before/after Clock CLK[1]	Setup Time / Hold Time					
ADDR inputs	T_{BACK}/T_{BCKA}	0.6 / 0	1.2 / 0	1.3 / 0	1.5 / 0	ns, min
DIN inputs	T_{BDCK}/T_{BCKD}	0.6 / 0	1.2 / 0	1.3 / 0	1.5 / 0	ns, min
EN input	T_{BECK}/T_{BCKE}	1.3 / 0	2.6 / 0	3.0 / 0	3.4 / 0	ns, min
RST input	T_{BRCK}/T_{BCKR}	1.3 / 0	2.5 / 0	2.7 / 0	3.2 / 0	ns, min
WEN input	T_{BWCK}/T_{BCKW}	1.2 / 0	2.3 / 0	2.6 / 0	3.0 / 0	ns, min
Clock CLK						
Minimum Pulse Width, High	T_{BPWH}	0.8	1.5	1.7	2.0	ns, min
Minimum Pulse Width, Low	T_{BPWL}	0.8	1.5	1.7	2.0	ns, min
CLKA -> CLKB setup time for different ports	T_{BCCS}		3.0	3.5	4.0	ns, min

Notes:
1. A Zero "0" Hold Time listing indicates no hold time or a negative hold time. Negative values can not be guaranteed "best-case", but if a "0" is listed, there is no positive hold time.

TBUF Switching Characteristics

Description	Symbol	Speed Grade				Units
		Min	-6	-5	-4	
Combinatorial Delays						
IN input to OUT output	T_{IO}	0	0	0	0	ns, max
TRI input to OUT output high-impedance	T_{OFF}	0.05	0.09	0.10	0.11	ns, max
TRI input to valid data on OUT output	T_{ON}	0.05	0.09	0.10	0.11	ns, max

JTAG Test Access Port Switching Characteristics

Description	Symbol	Speed Grade			Units
		-6	-5	-4	
TMS and TDI Setup times before TCK	T_{TAPTCK}	4.0	4.0	4.0	ns, min
TMS and TDI Hold times after TCK	T_{TCKTAP}	2.0	2.0	2.0	ns, min
Output delay from clock TCK to output TDO	T_{TCKTDO}	11.0	11.0	11.0	ns, max
Maximum TCK clock frequency	F_{TCK}	33	33	33	MHz, max

Virtex Pin-to-Pin Output Parameter Guidelines

All devices are 100% functionally tested. Listed below are representative values for typical pin locations and normal clock loading. Values are expressed in nanoseconds unless otherwise noted.

Global Clock Input to Output Delay for LVTTL, 12 mA, Fast Slew Rate, *with* DLL

Description	Symbol	Device	Speed Grade				Units
			Min	-6	-5	-4	
LVTTL Global Clock Input to Output Delay using Output Flip-flop, 12 mA, Fast Slew Rate, *with* DLL. For data *output* with different standards, adjust delays with the values shown in Output Delay Adjustments.	$T_{ICKOFDLL}$	XCV50	1.0	3.1	3.3	3.6	ns, max
		XCV100	1.0	3.1	3.3	3.6	ns, max
		XCV150	1.0	3.1	3.3	3.6	ns, max
		XCV200	1.0	3.1	3.3	3.6	ns, max
		XCV300	1.0	3.1	3.3	3.6	ns, max
		XCV400	1.0	3.1	3.3	3.6	ns, max
		XCV600	1.0	3.1	3.3	3.6	ns, max
		XCV800	1.0	3.1	3.3	3.6	ns, max
		XCV1000	1.0	3.1	3.3	3.6	ns, max

Notes:
1. Listed above are representative values where one global clock input drives one vertical clock line in each accessible column, and where all accessible IOB and CLB flip-flops are clocked by the global clock net.
2. Output timing is measured at 1.4 V with 35 pF external capacitive load for LVTTL. The 35 pF load does not apply to the Min values. For other I/O standards and different loads, see Table 2 and Table 3.
3. DLL output jitter is already included in the timing calculation.

Global Clock Input-to-Output Delay for LVTTL, 12 mA, Fast Slew Rate, *without* DLL

Description	Symbol	Device	Speed Grade				Units
			Min	-6	-5	-4	
LVTTL Global Clock Input to Output Delay using Output Flip-flop, 12 mA, Fast Slew Rate, *without* DLL. For data *output* with different standards, adjust delays with the values shown in Input and Output Delay Adjustments. For I/O standards requiring V_{REF}, such as GTL, GTL+, SSTL, HSTL, CTT, and AGO, an additional 600 ps must be added.	T_{ICKOF}	XCV50	1.5	4.6	5.1	5.7	ns, max
		XCV100	1.5	4.6	5.1	5.7	ns, max
		XCV150	1.5	4.7	5.2	5.8	ns, max
		XCV200	1.5	4.7	5.2	5.8	ns, max
		XCV300	1.5	4.7	5.2	5.9	ns, max
		XCV400	1.5	4.8	5.3	6.0	ns, max
		XCV600	1.6	4.9	5.4	6.0	ns, max
		XCV800	1.6	4.9	5.5	6.2	ns, max
		XCV1000	1.7	5.0	5.6	6.3	ns, max

Notes:
1. Listed above are representative values where one global clock input drives one vertical clock line in each accessible column, and where all accessible IOB and CLB flip-flops are clocked by the global clock net.
2. Output timing is measured at 1.4 V with 35 pF external capacitive load for LVTTL. The 35 pF load does not apply to the Min values. For other I/O standards and different loads, see Table 2 and Table 3.

Date	Version	Revision
01/00	1.9	Updated DLL Jitter Parameter table and waveforms, added Delay Measurement Methodology table for different I/O standards, changed buffered Hex line info and Input/Output Timing measurement notes.
03/00	2.0	New TBCKO values; corrected FG680 package connection drawing; new note about status of CCLK pin after configuration.
05/00	2.1	Modified "Pins not listed..." statement. Speed grade update to Final status.
05/00	2.2	Modified Table 18.
09/00	2.3	• Added XCV400 values to table under **Minimum Clock-to-Out for Virtex Devices**. • Corrected Units column in table under **IOB Input Switching Characteristics**. • Added values to table under **CLB SelectRAM Switching Characteristics**.
10/00	2.4	• Corrected Pinout information for devices in the BG256, BG432, and BG560 packages in Table 18. • Corrected **BG256 Pin Function Diagram**.
04/02/01	2.5	• Revised minimums for **Global Clock Set-Up and Hold for LVTTL Standard, with DLL**. • Converted file to modularized format. See the **Virtex Data Sheet** section.
04/19/01	2.6	• Clarified TIOCKP and TIOCKON **IOB Output Switching Characteristics** descriptors.
07/19/01	2.7	• Under **Absolute Maximum Ratings**, changed (T_{SOL}) to 220 °C.
07/26/01	2.8	• Removed T_{SOL} parameter and added footnote to **Absolute Maximum Ratings** table.
10/29/01	2.9	• Updated the speed grade designations used in data sheets, and added Table 1, which shows the current speed grade designation for each device.
02/01/02	3.0	• Added footnote to **DC Input and Output Levels** table.
07/19/02	3.1	• Removed mention of MIL-M-38510/605 specification. • Added link to xapp158 from the **Power-On Power Supply Requirements** section.
09/10/02	3.2	• Added Clock CLK to **IOB Input Switching Characteristics** and **IOB Output Switching Characteristics**.
03/01/13	4.0	The products listed in this data sheet are obsolete. See **XCN10016** for further information.

Virtex Data Sheet

The Virtex Data Sheet contains the following modules:

- DS003-1, Virtex 2.5V FPGAs:
  Introduction and Ordering Information (Module 1)
- DS003-2, Virtex 2.5V FPGAs:
  Functional Description (Module 2)
- DS003-3, Virtex 2.5V FPGAs:
  DC and Switching Characteristics (Module 3)
- DS003-4, Virtex 2.5V FPGAs:
  Pinout Tables (Module 4)

Virtex Pinout Information

Pinout Tables

See **www.xilinx.com** for updates or additional pinout information. For convenience, Table 2, Table 3 and Table 4 list the locations of special-purpose and power-supply pins. Pins not listed are either user I/Os or not connected, depending on the device/package combination. See the Pinout Diagrams starting on page 17 for any pins not listed for a particular part/package combination.

Table 2: **Virtex Pinout Tables (Chip-Scale and QFP Packages)**

Pin Name	Device	CS144	TQ144	PQ/HQ240

Pinout Diagrams

The following diagrams, **CS144 Pin Function Diagram**, page 17 through **FG680 Pin Function Diagram**, page 27, illustrate the locations of special-purpose pins on Virtex FPGAs. Table 5 lists the symbols used in these diagrams. The diagrams also show I/O-bank boundaries.

Table 5: **Pinout Diagram Symbols**

Symbol	Pin Function
✳	General I/O
❄	Device-dependent general I/O, n/c on smaller devices
V	V_{CCINT}
v	Device-dependent V_{CCINT}, n/c on smaller devices
O	V_{CCO}
R	V_{REF}
r	Device-dependent V_{REF}, remains I/O on smaller devices
G	Ground
Ø, 1, 2, 3	Global Clocks
⓿, ❶, ❷	M0, M1, M2
⓪, ①, ②, ③, ④, ⑤, ⑥, ⑦	D0/DIN, D1, D2, D3, D4, D5, D6, D7
B	DOUT/BUSY
D	DONE
P	$\overline{\text{PROGRAM}}$
I	$\overline{\text{INIT}}$
K	CCLK
W	$\overline{\text{WRITE}}$
S	$\overline{\text{CS}}$
T	Boundary-scan Test Access Port
+	Temperature diode, anode
–	Temperature diode, cathode
n	No connect
