### Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

### Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

#### Details

|                                |   |
|--------------------------------|---|
| Product Status                 | Obsolete  |
| Number of LABs/CLBs            | 384   |
| Number of Logic Elements/Cells | 1728  |
| Total RAM Bits                 | 32768   |
| Number of I/O                  | 176   |
| Number of Gates                | 57906   |
| Voltage - Supply               | 2.375V ~ 2.625V   |
| Mounting Type                  | Surface Mount   |
| Operating Temperature          | 0°C ~ 85°C (TJ)   |
| Package / Case                 | 256-BGA   |
| Supplier Device Package        | 256-FBGA (17x17)  |
| Purchase URL                   | <a href="https://www.e-xfl.com/product-detail/xilinx/xcv50-4fg256c">https://www.e-xfl.com/product-detail/xilinx/xcv50-4fg256c</a> |

## Virtex Architecture

Virtex devices feature a flexible, regular architecture that comprises an array of configurable logic blocks (CLBs) surrounded by programmable input/output blocks (IOBs), all interconnected by a rich hierarchy of fast, versatile routing resources. The abundance of routing resources permits the Virtex family to accommodate even the largest and most complex designs.

Virtex FPGAs are SRAM-based, and are customized by loading configuration data into internal memory cells. In some modes, the FPGA reads its own configuration data from an external PROM (master serial mode). Otherwise, the configuration data is written into the FPGA (SelectMAP™, slave serial, and JTAG modes).

The standard Xilinx Foundation™ and Alliance Series™ Development systems deliver complete design support for Virtex, covering every aspect from behavioral and schematic entry, through simulation, automatic design translation and implementation, to the creation, downloading, and readback of a configuration bit stream.

## Higher Performance

Virtex devices provide better performance than previous generations of FPGA. Designs can achieve synchronous system clock rates up to 200 MHz including I/O. Virtex inputs and outputs comply fully with PCI specifications, and interfaces can be implemented that operate at 33 MHz or 66 MHz. Additionally, Virtex supports the hot-swapping requirements of Compact PCI.

Xilinx thoroughly benchmarked the Virtex family. While performance is design-dependent, many designs operated internally at speeds in excess of 100 MHz and can achieve 200 MHz. Table 2 shows performance data for representative circuits, using worst-case timing parameters.

Table 2: Performance for Common Circuit Functions

| Function                | Bits    | Virtex -6 |
|-------------------------|---------|-----------|
| Register-to-Register    |         |           |
| Adder                   | 16      | 5.0 ns    |
|                         | 64      | 7.2 ns    |
| Pipelined Multiplier    | 8 x 8   | 5.1 ns    |
|                         | 16 x 16 | 6.0 ns    |
| Address Decoder         | 16      | 4.4 ns    |
|                         | 64      | 6.4 ns    |
| 16:1 Multiplexer        |         | 5.4 ns    |
| Parity Tree             | 9       | 4.1 ns    |
|                         | 18      | 5.0 ns    |
|                         | 36      | 6.9 ns    |
| Chip-to-Chip            |         |           |
| HSTL Class IV           |         | 200 MHz   |
| LVTTTL, 16mA, fast slew |         | 180 MHz   |

### Virtex Device/Package Combinations and Maximum I/O

Table 3: Virtex Family Maximum User I/O by Device/Package (Excluding Dedicated Clock Pins)

| Package | XCV50 | XCV100 | XCV150 | XCV200 | XCV300 | XCV400 | XCV600 | XCV800 | XCV1000 |

Figure 2: Virtex Input/Output Block (IOB)

Table 1: Supported Select I/O Standards

| I/O Standard       | Input Reference Voltage ( $V_{REF}$ ) | Output Source Voltage ( $V_{CCO}$ ) | Board Termination Voltage ( $V_{TT}$ ) | 5 V Tolerant |
|--------------------|---------------------------------------|-------------------------------------|--|--------------|
| LVTTL 2 – 24 mA    | N/A                                   | 3.3                                 | N/A                                    | Yes          |
| LVC MOS2           | N/A                                   | 2.5                                 | N/A                                    | Yes          |
| PCI, 5 V           | N/A                                   | 3.3                                 | N/A                                    | Yes          |
| PCI, 3.3 V         | N/A                                   | 3.3                                 | N/A                                    | No           |
| GTL                | 0.8                                   | N/A                                 | 1.2                                    | No           |
| GTL+               | 1.0                                   | N/A                                 | 1.5                                    | No           |
| HSTL Class I       | 0.75                                  | 1.5                                 | 0.75                                   | No           |
| HSTL Class III     | 0.9                                   | 1.5                                 | 1.5                                    | No           |
| HSTL Class IV      | 0.9                                   | 1.5                                 | 1.5                                    | No           |
| SSTL3 Class I & II | 1.5                                   | 3.3                                 | 1.5                                    | No           |
| SSTL2 Class I & II | 1.25                                  | 2.5                                 | 1.25                                   | No           |
| CTT                | 1.5                                   | 3.3                                 | 1.5                                    | No           |
| AGP                | 1.32                                  | 3.3                                 | N/A                                    | No           |

### Input Path

A buffer in the Virtex IOB input path routes the input signal either directly to internal logic or through an optional input flip-flop.

An optional delay element at the D-input of this flip-flop eliminates pad-to-pad hold time. The delay is matched to the internal clock-distribution delay of the FPGA, and when used, assures that the pad-to-pad hold time is zero.

Each input buffer can be configured to conform to any of the low-voltage signalling standards supported. In some of these standards the input buffer utilizes a user-supplied threshold voltage,  $V_{REF}$ . The need to supply  $V_{REF}$  imposes constraints on which standards can be used in close proximity to each other. See [I/O Banking, page 3](#).

There are optional pull-up and pull-down resistors at each user I/O input for use after configuration. Their value is in the range 50 k $\Omega$  – 100 k $\Omega$ .

### Output Path

The output path includes a 3-state output buffer that drives the output signal onto the pad. The output signal can be routed to the buffer directly from the internal logic or through an optional IOB output flip-flop.

The 3-state control of the output can also be routed directly from the internal logic or through a flip-flop that provides synchronous enable and disable.

Each output driver can be individually programmed for a wide range of low-voltage signalling standards. Each output buffer can source up to 24 mA and sink up to 48mA. Drive strength and slew rate controls minimize bus transients.

In most signalling standards, the output High voltage depends on an externally supplied  $V_{CCO}$  voltage. The need to supply  $V_{CCO}$  imposes constraints on which standards can be used in close proximity to each other. See [I/O Banking, page 3](#).

An optional weak-keeper circuit is connected to each output. When selected, the circuit monitors the voltage on the pad and weakly drives the pin High or Low to match the input signal. If the pin is connected to a multiple-source signal, the weak keeper holds the signal in its last state if all drivers are disabled. Maintaining a valid logic level in this way eliminates bus chatter.

Because the weak-keeper circuit uses the IOB input buffer to monitor the input level, an appropriate  $V_{REF}$  voltage must be provided if the signalling standard requires one. The provision of this voltage must comply with the I/O banking rules.

### I/O Banking

Some of the I/O standards described above require  $V_{CCO}$  and/or  $V_{REF}$  voltages. These voltages externally and connected to device pins that serve groups of IOBs, called banks. Consequently, restrictions exist about which I/O standards can be combined within a given bank.

Eight I/O banks result from separating each edge of the FPGA into two banks, as shown in [Figure 3](#). Each bank has multiple  $V_{CCO}$  pins, all of which must be connected to the same voltage. This voltage is determined by the output standards in use.

X8778\_b

Figure 3: Virtex I/O Banks

Within a bank, output standards can be mixed only if they use the same  $V_{CCO}$ . Compatible standards are shown in [Table 2](#). GTL and GTL+ appear under all voltages because their open-drain outputs do not depend on  $V_{CCO}$ .

Table 2: Compatible Output Standards

| $V_{CCO}$ | Compatible Standards                                |
|-----------|---|
| 3.3 V     | PCI, LVTTTL, SSTL3 I, SSTL3 II, CTT, AGP, GTL, GTL+ |
| 2.5 V     | SSTL2 I, SSTL2 II, LVCMOS2, GTL, GTL+               |
| 1.5 V     | HSTL I, HSTL III, HSTL IV, GTL, GTL+                |

Some input standards require a user-supplied threshold voltage,  $V_{REF}$ . In this case, certain user-I/O pins are automatically configured as inputs for the  $V_{REF}$  voltage. Approximately one in six of the I/O pins in the bank assume this role.

The  $V_{REF}$  pins within a bank are interconnected internally and consequently only one  $V_{REF}$  voltage can be used within each bank. All  $V_{REF}$  pins in the bank, however, must be connected to the external voltage source for correct operation.

Within a bank, inputs that require  $V_{REF}$  can be mixed with those that do not. However, only one  $V_{REF}$  voltage can be used within a bank. Input buffers that use  $V_{REF}$  are not 5 V tolerant. LVTTTL, LVCMOS2, and PCI 33 MHz 5 V, are 5 V tolerant.

The  $V_{CCO}$  and  $V_{REF}$  pins for each bank appear in the device Pinout tables and diagrams. The diagrams also show the bank affiliation of each I/O.

Within a given package, the number of  $V_{REF}$  and  $V_{CCO}$  pins can vary depending on the size of device. In larger devices,

## General Purpose Routing

Most Virtex signals are routed on the general purpose routing, and consequently, the majority of interconnect resources are associated with this level of the routing hierarchy. The general routing resources are located in horizontal and vertical routing channels associated with the rows and columns CLBs. The general-purpose routing resources are listed below.

- Adjacent to each CLB is a General Routing Matrix (GRM). The GRM is the switch matrix through which horizontal and vertical routing resources connect, and is also the means by which the CLB gains access to the general purpose routing.
- 24 single-length lines route GRM signals to adjacent GRMs in each of the four directions.
- 12 buffered Hex lines route GRM signals to another GRMs six-blocks away in each one of the four directions. Organized in a staggered pattern, Hex lines can be driven only at their endpoints. Hex-line signals can be accessed either at the endpoints or at the midpoint (three blocks from the source). One third of the Hex lines are bidirectional, while the remaining ones are uni-directional.

- 12 Longlines are buffered, bidirectional wires that distribute signals across the device quickly and efficiently. Vertical Longlines span the full height of the device, and horizontal ones span the full width of the device.

## I/O Routing

Virtex devices have additional routing resources around their periphery that form an interface between the CLB array and the IOBs. This additional routing, called the VersaRing, facilitates pin-swapping and pin-locking, such that logic redesigns can adapt to existing PCB layouts. Time-to-market is reduced, since PCBs and other system components can be manufactured while the logic design is still in progress.

## Dedicated Routing

Some classes of signal require dedicated routing resources to maximize performance. In the Virtex architecture, dedicated routing resources are provided for two classes of signal.

- Horizontal routing resources are provided for on-chip 3-state busses. Four partitionable bus lines are provided per CLB row, permitting multiple busses within a row, as shown in Figure 8.
- Two dedicated nets per CLB propagate carry signals vertically to the adjacent CLB.

Figure 8: BUFT Connections to Dedicated Horizontal Bus Lines

## Global Routing

Global Routing resources distribute clocks and other signals with very high fanout throughout the device. Virtex devices include two tiers of global routing resources referred to as primary global and secondary local clock routing resources.

- The primary global routing resources are four dedicated global nets with dedicated input pins that are designed to distribute high-fanout clock signals with minimal skew. Each global clock net can drive all CLB, IOB, and block RAM clock pins. The primary global nets can only be driven by global buffers. There are four global buffers, one for each global net.

- The secondary local clock routing resources consist of 24 backbone lines, 12 across the top of the chip and 12 across bottom. From these lines, up to 12 unique signals per column can be distributed via the 12 longlines in the column. These secondary resources are more flexible than the primary resources since they are not restricted to routing only to clock pins.

## Clock Distribution

Virtex provides high-speed, low-skew clock distribution through the primary global routing resources described above. A typical clock distribution net is shown in Figure 9.

Four global buffers are provided, two at the top center of the device and two at the bottom center. These drive the four primary global nets that in turn drive any clock pin.

Figure 11: Boundary Scan Bit Sequence

Table 5: Boundary Scan Instructions

| Boundary-Scan Command | Binary Code(4:0) | Description   |
|-----------------------|------------------|---|
| EXTEST                | 00000            | Enables boundary-scan EXTEST operation                  |
| SAMPLE/PRELOAD        | 00001            | Enables boundary-scan SAMPLE/PRELOAD operation          |
| USER 1                | 00010            | Access user-defined register 1                          |
| USER 2                | 00011            | Access user-defined register 2                          |
| CFG_OUT               | 00100            | Access the configuration bus for read operations.       |
| CFG_IN                | 00101            | Access the configuration bus for write operations.      |
| INTEST                | 00111            | Enables boundary-scan INTEST operation                  |
| USERCODE              | 01000            | Enables shifting out USER code                          |
| IDCODE                | 01001            | Enables shifting out of ID Code                         |
| HIGHZ                 | 01010            | 3-states output pins while enabling the Bypass Register |
| JSTART                | 01100            | Clock the start-up sequence when StartupClk is TCK      |
| BYPASS                | 11111            | Enables BYPASS  |
| RESERVED              | All other codes  | Xilinx reserved instructions                            |

## Identification Registers

The IDCODE register is supported. By using the IDCODE, the device connected to the JTAG port can be determined.

The IDCODE register has the following binary format:

vvvv:ffff:ffa:aaaa:aaaa:cccc:cccc:ccc1

where

v = the die version number

f = the family code (03h for Virtex family)

a = the number of CLB rows (ranges from 010h for XCV50 to 040h for XCV1000)

c = the company code (49h for Xilinx)

The USERCODE register is supported. By using the USERCODE, a user-programmable identification code can be loaded and shifted out for examination. The identification code is embedded in the bitstream during bitstream generation and is valid only after configuration.

Table 6: IDCODEs Assigned to Virtex FPGAs

| FPGA    | IDCODE    |
|---------|-----------|
| XCV50   | v0610093h |
| XCV100  | v0614093h |
| XCV150  | v0618093h |
| XCV200  | v061C093h |
| XCV300  | v0620093h |
| XCV400  | v0628093h |
| XCV600  | v0630093h |
| XCV800  | v0638093h |
| XCV1000 | v0640093h |

## Including Boundary Scan in a Design

Since the boundary scan pins are dedicated, no special element needs to be added to the design unless an internal data register (USER1 or USER2) is desired.

If an internal data register is used, insert the boundary scan symbol and connect the necessary pins as appropriate.

## Development System

Virtex FPGAs are supported by the Xilinx Foundation and Alliance CAE tools. The basic methodology for Virtex design consists of three interrelated steps: design entry, implementation, and verification. Industry-standard tools are used for design entry and simulation (for example, Synopsys FPGA Express), while Xilinx provides proprietary architecture-specific tools for implementation.

The Xilinx development system is integrated under the Xilinx Design Manager (XDM™) software, providing design-

ers with a common user interface regardless of their choice of entry and verification tools. The XDM software simplifies the selection of implementation options with pull-down menus and on-line help.

Application programs ranging from schematic capture to Placement and Routing (PAR) can be accessed through the XDM software. The program command sequence is generated prior to execution, and stored for documentation.

Several advanced software features facilitate Virtex design. RPMs, for example, are schematic-based macros with relative location constraints to guide their placement. They help ensure optimal implementation of common functions.

For HDL design entry, the Xilinx FPGA Foundation development system provides interfaces to the following synthesis design environments.

- Synopsys (FPGA Compiler, FPGA Express)
- Exemplar (Spectrum)
- Synplicity (Synplify)

For schematic design entry, the Xilinx FPGA Foundation and alliance development system provides interfaces to the following schematic-capture design environments.

- Mentor Graphics V8 (Design Architect, QuickSim II)
- Viewlogic Systems (Viewdraw)

Third-party vendors support many other environments.

A standard interface-file specification, Electronic Design Interchange Format (EDIF), simplifies file transfers into and out of the development system.

Virtex FPGAs supported by a unified library of standard functions. This library contains over 400 primitives and macros, ranging from 2-input AND gates to 16-bit accumulators, and includes arithmetic functions, comparators, counters, data registers, decoders, encoders, I/O functions, latches, Boolean functions, multiplexers, shift registers, and barrel shifters.

The “soft macro” portion of the library contains detailed descriptions of common logic functions, but does not contain any partitioning or placement information. The performance of these macros depends, therefore, on the partitioning and placement obtained during implementation.

RPMs, on the other hand, do contain predetermined partitioning and placement information that permits optimal implementation of these functions. Users can create their own library of soft macros or RPMs based on the macros and primitives in the standard library.

The design environment supports hierarchical design entry, with high-level schematics that comprise major functional blocks, while lower-level schematics define the logic in these blocks. These hierarchical design elements are automatically combined by the implementation tools. Different design entry tools can be combined within a hierarchical

design, thus allowing the most convenient entry method to be used for each portion of the design.

## Design Implementation

The place-and-route tools (PAR) automatically provide the implementation flow described in this section. The partitioner takes the EDIF net list for the design and maps the logic into the architectural resources of the FPGA (CLBs and IOBs, for example). The placer then determines the best locations for these blocks based on their interconnections and the desired performance. Finally, the router interconnects the blocks.

The PAR algorithms support fully automatic implementation of most designs. For demanding applications, however, the user can exercise various degrees of control over the process. User partitioning, placement, and routing information is optionally specified during the design-entry process. The implementation of highly structured designs can benefit greatly from basic floor planning.

The implementation software incorporates Timing Wizard® timing-driven placement and routing. Designers specify timing requirements along entire paths during design entry. The timing path analysis routines in PAR then recognize these user-specified requirements and accommodate them.

Timing requirements are entered on a schematic in a form directly relating to the system requirements, such as the targeted clock frequency, or the maximum allowable delay between two registers. In this way, the overall performance of the system along entire signal paths is automatically tailored to user-generated specifications. Specific timing information for individual nets is unnecessary.

## Design Verification

In addition to conventional software simulation, FPGA users can use in-circuit debugging techniques. Because Xilinx devices are infinitely reprogrammable, designs can be verified in real time without the need for extensive sets of software simulation vectors.

The development system supports both software simulation and in-circuit debugging techniques. For simulation, the system extracts the post-layout timing information from the design database, and back-annotates this information into the net list for use by the simulator. Alternatively, the user can verify timing-critical portions of the design using the TRACE® static timing analyzer.

For in-circuit debugging, the development system includes a download and readback cable. This cable connects the FPGA in the target system to a PC or workstation. After downloading the design into the FPGA, the designer can single-step the logic, readback the contents of the flip-flops, and so observe the internal logic state. Simple modifications can be downloaded into the system in a matter of minutes.

| Date     | Version | Revision   |
|----------|---------|--|
| 01/00    | 1.9     | Updated DLL Jitter Parameter table and waveforms, added Delay Measurement Methodology table for different I/O standards, changed buffered Hex line info and Input/Output Timing measurement notes.   |
| 03/00    | 2.0     | New TBCKO values; corrected FG680 package connection drawing; new note about status of CCLK pin after configuration.   |
| 05/00    | 2.1     | Modified “Pins not listed...” statement. Speed grade update to Final status.   |
| 05/00    | 2.2     | Modified Table 18.   |
| 09/00    | 2.3     | <ul style="list-style-type: none"> <li>Added XCV400 values to table under <b>Minimum Clock-to-Out for Virtex Devices</b>.</li> <li>Corrected Units column in table under <b>IOB Input Switching Characteristics</b>.</li> <li>Added values to table under <b>CLB SelectRAM Switching Characteristics</b>.</li> </ul> |

## Virtex Data Sheet

The Virtex Data Sheet contains the following modules:

- DS003-1, Virtex 2.5V FPGAs:  
Introduction and Ordering Information (Module 1)
- DS003-2, Virtex 2.5V FPGAs:  
Functional Description (Module 2)
- DS003-3, Virtex 2.5V FPGAs:  
DC and Switching Characteristics (Module 3)
- DS003-4, Virtex 2.5V FPGAs:  
Pinout Tables (Module 4)

### Virtex Switching Characteristics

All devices are 100% functionally tested. Internal timing parameters are derived from measuring internal test patterns. Listed below are representative values. For more specific, more precise, and worst-case guaranteed data, use the values reported by the static timing analyzer (TRCE

in the Xilinx Development System) and back-annotated to the simulation net list. All timing parameters assume worst-case operating conditions (supply voltage and junction temperature). Values apply to all Virtex devices unless otherwise noted.

### IOB Input Switching Characteristics

Input delays associated with the pad are specified for LVTTTL levels. For other standards, adjust the delays with the values shown in , page 6.

| Description  | Device  | Symbol              | Speed Grade |     |     |     | Units   |
|--|---------|---------------------|-------------|-----|-----|-----|---------|
|  |         |                     | Min         | -6  | -5  | -4  |         |
| Propagation Delays                                 |         |                     |             |     |     |     |         |
| Pad to I output, no delay                          | All     | T <sub>IOPI</sub>   | 0.39        | 0.8 | 0.9 | 1.0 | ns, max |
| Pad to I output, with delay                        | XCV50   | T <sub>IOPID</sub>  | 0.8         | 1.5 | 1.7 | 1.9 | ns, max |
|  | XCV100  |                     | 0.8         | 1.5 | 1.7 | 1.9 | ns, max |

#### Notes:

- Input timing for LVTTL is measured at 1.4 V. For other I/O standards, see [Table 3](#).

### IOB Output Switching Characteristics

Output delays terminating at a pad are specified for LVTTL with 12 mA drive and fast slew rate. For other standards, adjust the delays with the values shown in [IOB Output Switching Characteristics Standard Adjustments, page 9](#).

| Description  | Symbol               | Speed Grade |     |     |     | Units   |
|--|----------------------|-------------|-----|-----|-----|---------|
|  |                      | Min         | -6  | -5  | -4  |         |
| Propagation Delays   |                      |             |     |     |     |         |

| SR input to Pad (asynchronous)                                    | $T_{IOSRP}$               | 1.6                           | 3.8     | 4.1     | 4.6     | ns, max |
| SR input to Pad high-impedance (asynchronous) <sup>(1)</sup>      | $T_{IOSRHZ}$              | 1.6                           | 3.1     | 3.4     | 3.9     | ns, max |
| SR input to valid data on Pad (asynchronous)                      | $T_{IOSRON}$              | 2.0                           | 4.2     | 4.6     | 5.1     | ns, max |
| GSR to Pad  | $T_{IOGSRQ}$              | 4.9                           | 9.7     | 10.9    | 12.5    | ns, max |

**Notes:**

1. 3-state turn-off delays should not be adjusted.
2. A Zero "0" Hold Time listing indicates no hold time or a negative hold time. Negative values can not be guaranteed "best-case", but if a "0" is listed, there is no positive hold time.

### IOB Output Switching Characteristics Standard Adjustments

Output delays terminating at a pad are specified for LVTTTL with 12 mA drive and fast slew rate. For other standards, adjust the delays by the values shown.

| Description  | Symbol                   | Standard <sup>(1)</sup> | Speed Grade |       |       |       | Unit<br>s |
|--|--------------------------|-------------------------|-------------|-------|-------|-------|-----------|
|  |                          |                         | Min         | -6    | -5    | -4    |           |
| Output Delay Adjustments   |                          |                         |             |       |       |       |           |
| Standard-specific adjustments for output delays terminating at pads (based on standard capacitive load, Csl) | T <sub>OLVTTTL_S2</sub>  | LVTTL, Slow, 2 mA       | 4.2         | 14.7  | 15.8  | 17.0  | ns        |

|  | T <sub>OAGP</sub>        | AGP                     | 0           | −0.9  | −0.9  | −1.0  | ns        |

#### Notes:

- Output timing is measured at 1.4 V with 35 pF external capacitive load for LVTTTL. For other I/O standards and different loads, see [Table 2](#) and [Table 3](#).

## CLB Arithmetic Switching Characteristics

Setup times not listed explicitly can be approximated by decreasing the combinatorial delays by the setup time adjustment listed. Precise values are provided by the timing analyzer.

| Description  | Symbol                               | Speed Grade |         |         |         | Units   |

| Setup and Hold Times before/after Clock CLK <sup>(1)</sup> | Setup Time / Hold Time               |             |         |         |         |         |
| CIN input to FFX   | T <sub>CCKX</sub> /T <sub>CKCX</sub> | 0.50 / 0    | 1.0 / 0 | 1.2 / 0 | 1.3 / 0 | ns, min |
| CIN input to FFY   | T <sub>CCKY</sub> /T <sub>CKCY</sub> | 0.53 / 0    | 1.1 / 0 | 1.2 / 0 | 1.4 / 0 | ns, min |

### Notes:

1. A Zero "0" Hold Time listing indicates no hold time or a negative hold time. Negative values can not be guaranteed "best-case", but if a "0" is listed, there is no positive hold time.

### DLL Timing Parameters

All devices are 100 percent functionally tested. Because of the difficulty in directly measuring many internal timing parameters, those parameters are derived from benchmark timing patterns. The following guidelines reflect worst-case values across the recommended operating conditions.

| Description                        | Symbol               | Speed Grade |     |     |     |     |     | Units |
|------------------------------------|----------------------|-------------|-----|-----|-----|-----|-----|-------|
|                                    |                      | -6          |     | -5  |     | -4  |     |       |
|                                    |                      | Min         | Max | Min | Max | Min | Max |       |
| Input Clock Frequency (CLKDLLHF)   | FCLKINHF             | 60          | 200 | 60  | 180 | 60  | 180 | MHz   |
| Input Clock Frequency (CLKDLL)     | FCLKINLF             | 25          | 100 | 25  | 90  | 25  | 90  | MHz   |
| Input Clock Pulse Width (CLKDLLHF) | T <sub>DLLPWHF</sub> | 2.0         | -   | 2.4 | -   | 2.4 | -   | ns    |
| Input Clock Pulse Width (CLKDLL)   | T <sub>DLLPWLF</sub> | 2.5         | -   | 3.0 |     | 3.0 | -   | ns    |

#### Notes:

1. All specifications correspond to Commercial Operating Temperatures (0°C to +85°C).

### DLL Clock Tolerance, Jitter, and Phase Information

All DLL output jitter and phase specifications determined through statistical measurement at the package pins using a clock mirror configuration and matched drivers.

| Description  | Symbol              | F <sub>CLKIN</sub> | CLKDLLHF |       | CLKDLL |       | Units |

#### Notes:

1. **Output Jitter** is cycle-to-cycle jitter measured on the DLL output clock, *excluding* input clock jitter.
2. **Phase Offset between CLKIN and CLKO** is the worst-case fixed time difference between rising edges of CLKIN and CLKO, *excluding* Output Jitter and input clock jitter.
3. **Phase Offset between Clock Outputs on the DLL** is the worst-case fixed time difference between rising edges of any two DLL outputs, *excluding* Output Jitter and input clock jitter.
4. **Maximum Phase Difference between CLKIN and CLKO** is the sum of Output Jitter and Phase Offset between CLKIN and CLKO, or the greatest difference between CLKIN and CLKO rising edges due to DLL alone (*excluding* input clock jitter).
5. **Maximum Phase Difference between Clock Outputs on the DLL** is the sum of Output Jitter and Phase Offset between any two DLL clock outputs, or the greatest difference between any two DLL output rising edges due to DLL alone (*excluding* input clock jitter).
6. All specifications correspond to Commercial Operating Temperatures (0°C to +85°C).

**Period Tolerance:** the allowed input clock period change in nanoseconds.

**Output Jitter:** the difference between an ideal reference clock edge and the actual design.

**Phase Offset and Maximum Phase Difference**

ds003\_20c\_110399

Figure 1: Frequency Tolerance and Clock Jitter

## Revision History

| Date  | Version | Revision  |
|-------|---------|---|
| 11/98 | 1.0     | Initial Xilinx release.   |
| 01/99 | 1.2     | Updated package drawings and specs.   |
| 02/99 | 1.3     | Update of package drawings, updated specifications.   |
| 05/99 | 1.4     | Addition of package drawings and specifications.  |
| 05/99 | 1.5     | Replaced FG 676 & FG680 package drawings.   |
| 07/99 | 1.6     | Changed Boundary Scan Information and changed Figure 11, Boundary Scan Bit Sequence. Updated IOB Input & Output delays. Added Capacitance info for different I/O Standards. Added 5 V tolerant information. Added DLL Parameters and waveforms and new Pin-to-pin Input and Output Parameter tables for Global Clock Input to Output and Setup and Hold. Changed Configuration Information including Figures 12, 14, 17 & 19. Added device-dependent listings for quiescent currents ICCINTQ and ICCOQ. Updated IOB Input and Output Delays based on default standard of LVTTTL, 12 mA, Fast Slew Rate. Added IOB Input Switching Characteristics Standard Adjustments. |
| 09/99 | 1.7     | Speed grade update to preliminary status, Power-on specification and Clock-to-Out Minimums additions, "0" hold time listing explanation, quiescent current listing update, and Figure 6 ADDRA input label correction. Added T <sub>IJITCC</sub> parameter, changed T <sub>OJIT</sub> to T <sub>OPHASE</sub> .   |
| 01/00 | 1.8     | Update to speed.txt file 1.96. Corrections for CRs 111036, 111137, 112697, 115479, 117153, 117154, and 117612. Modified notes for Recommended Operating Conditions (voltage and temperature). Changed Bank information for V <sub>CCO</sub> in CS144 package on p.43.   |

Table 3: Virtex Pinout Tables (BGA) (Continued)

| Pin Name  | Device     | BG256     | BG352            | BG432                  | BG560                        |
|---|------------|-----------|------------------|------------------------|------------------------------|
| <b>V<sub>REF</sub> Bank 3</b><br>(V <sub>REF</sub> pins are listed incrementally. Connect all pins listed for both the required device and all smaller devices listed in the same package.)<br>Within each bank, if input reference voltage is not required, all V <sub>REF</sub> pins are general I/O. | XCV50      | M18, V20  | N/A              | N/A                    | N/A                          |

## Revision History

| Date        | Version | Revision  |
|-------------|---------|---|
| 11/98       | 1.0     | Initial Xilinx release.   |
| 01/99-02/99 | 1.2-1.3 | Both versions updated package drawings and specs.   |
| 05/99       | 1.4     | Addition of package drawings and specifications.  |
| 05/99       | 1.5     | Replaced FG 676 & FG680 package drawings.   |
| 07/99       | 1.6     | Changed Boundary Scan Information and changed Figure 11, Boundary Scan Bit Sequence. Updated IOB Input & Output delays. Added Capacitance info for different I/O Standards. Added 5 V tolerant information. Added DLL Parameters and waveforms and new Pin-to-pin Input and Output Parameter tables for Global Clock Input to Output and Setup and Hold. Changed Configuration Information including Figures 12, 14, 17 & 19. Added device-dependent listings for quiescent currents ICCINTQ and ICCOQ. Updated IOB Input and Output Delays based on default standard of LVTTTL, 12 mA, Fast Slew Rate. Added IOB Input Switching Characteristics Standard Adjustments. |
| 09/99       | 1.7     | Speed grade update to preliminary status, Power-on specification and Clock-to-Out Minimums additions, "0" hold time listing explanation, quiescent current listing update, and Figure 6 ADDRA input label correction. Added $T_{IJITCC}$ parameter, changed $T_{OJIT}$ to $T_{OPHASE}$ .  |
| 01/00       | 1.8     | Update to speed.txt file 1.96. Corrections for CRs 111036, 111137, 112697, 115479, 117153, 117154, and 117612. Modified notes for Recommended Operating Conditions (voltage and temperature). Changed Bank information for $V_{CCO}$ in CS144 package on p.43.  |
| 01/00       | 1.9     | Updated DLL Jitter Parameter table and waveforms, added Delay Measurement Methodology table for different I/O standards, changed buffered Hex line info and Input/Output Timing measurement notes.  |
| 03/00       | 2.0     | New TBCKO values; corrected FG680 package connection drawing; new note about status of CCLK pin after configuration.  |
| 05/00       | 2.1     | Modified "Pins not listed..." statement. Speed grade update to Final status.  |
| 05/00       | 2.2     | Modified Table 18.  |
| 09/00       | 2.3     | <ul style="list-style-type: none"> <li>Added XCV400 values to table under <b>Minimum Clock-to-Out for Virtex Devices</b>.</li> <li>Corrected Units column in table under <b>IOB Input Switching Characteristics</b>.</li> <li>Added values to table under <b>CLB SelectRAM Switching Characteristics</b>.</li> </ul>  |
| 10/00       | 2.4     | <ul style="list-style-type: none"> <li>Corrected pinout info for devices in the BG256, BG432, and BG560 pkgs in Table 18.</li> <li>Corrected <b>BG256 Pin Function Diagram</b>.</li> </ul>  |
| 04/02/01    | 2.5     | <ul style="list-style-type: none"> <li>Revised minimums for <b>Global Clock Set-Up and Hold for LVTTTL Standard, with DLL</b>.</li> <li>Converted file to modularized format. See section <b>Virtex Data Sheet</b>, below.</li> </ul>   |
| 04/19/01    | 2.6     | <ul style="list-style-type: none"> <li>Corrected pinout information for FG676 device in <b>Table 4</b>. (Added AB22 pin.)</li> </ul>  |
| 07/19/01    | 2.7     | <ul style="list-style-type: none"> <li>Clarified <math>V_{CCINT}</math> pinout information and added AE19 pin for BG352 devices in <b>Table 3</b>.</li> <li>Changed pinouts listed for BG352 XCV400 devices in banks 0 thru 7.</li> </ul>   |
| 07/19/02    | 2.8     | <ul style="list-style-type: none"> <li>Changed pinouts listed for GND in TQ144 devices (see <b>Table 2</b>).</li> </ul>   |
| 03/01/13    | 4.0     | The products listed in this data sheet are obsolete. See <a href="#">XCN10016</a> for further information.  |

## Virtex Data Sheet

The Virtex Data Sheet contains the following modules:

- DS003-1, Virtex 2.5V FPGAs:  
Introduction and Ordering Information (Module 1)
- DS003-2, Virtex 2.5V FPGAs:  
Functional Description (Module 2)
- DS003-3, Virtex 2.5V FPGAs:  
DC and Switching Characteristics (Module 3)
- DS003-4, Virtex 2.5V FPGAs:  
Pinout Tables (Module 4)
