Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details

Product Status	Obsolete
Number of LABs/CLBs	-
Number of Logic Elements/Cells	6400
Total RAM Bits	-
Number of I/O	204
Number of Gates	30000
Voltage - Supply	4.75V ~ 5.25V
Mounting Type	Surface Mount
Operating Temperature	0°C ~ 70°C (TC)
Package / Case	240-BFQFP
Supplier Device Package	240-PQFP (32x32)
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/at6010h-2qc

A user-configurable bit determines the threshold level – TTL or CMOS – of the input buffer.

A user-configurable bit which enables or disables the active pull-up of the output device.

A user-configurable bit controls the slew rate – fast or slow – of the output buffer. A slow slew rate, which reduces noise and ground bounce, is recommended for outputs that are not speed-critical. Fast and slow slew rates have the same DC-current sinking capabilities, but the rate at which each allows the output devices to reach full drive differs.

A user-configurable bit controls the pull-up transistor in the I/O pin. It's primary function is to provide a logical "1" to unused input pins. When on, it is approximately equivalent to a 25K resistor to V_{CC} .

User-configurable bits determine the output-enable for the output driver. The output driver can be static – always on or always off – or dynamically controlled by a signal generated in the array. Four options are available from the array: (1) the control is low and always driving; (2) the control is high and never driving; (3) the control is connected to a vertical local bus associated with the output cell; or (4) the control is connected to a horizontal local bus associated with the output cell. On power-up, the user I/Os are configured as inputs with pull-up resistors.

Chip Configuration

Users select from several configuration modes. Many factors, including board area, configuration speed and the number of designs implemented in parallel can influence the user's final choice.

Configuration is controlled by dedicated configuration pins and dual-function pins that double as I/O pins when the device is in operation. The number of dual-function pins required for each mode varies.

The devices can be partially reconfigured while in operation. Portions of the device not being modified remain operational during reconfiguration. Simultaneous configuration of more than one device is also possible. Full configuration takes as little as a millisecond, partial configuration is even faster.

Refer to the Pin Function Description section following for a brief summary of the pins used in configuration. For more information about configuration, refer to the AT6000 Series Configuration data sheet.

Pin Function Description

This section provides abbreviated descriptions of the various AT6000 Series pins. For more complete descriptions, refer to the AT6000 Series Configuration data sheet.

Pinout tables for the AT6000 series of devices follow.

Power Pins

V_{CC} , V_{DD} , GND, V_{SS}

V_{CC} and GND are the I/O supply pins, V_{DD} and V_{SS} are the internal logic supply pins. V_{CC} and V_{DD} should be tied to the same trace on the printed circuit board. GND and V_{SS} should be tied to the same trace on the printed circuit board.

Input/Output Pins

All I/O pins can be used in the same way (refer to the I/O section of the architecture description). Some I/O pins are dual-function pins used during configuration of the array. When not being used for configuration, dual-function I/Os are fully functional as normal I/O pins. On initial power-up, all I/Os are configured as TTL inputs with a pull-up.

Dedicated Timing and Control Pins

$\overline{CON}$

Configuration-in-process pin. After power-up, $\overline{CON}$ stays low until power-up initialization is complete, at which time $\overline{CON}$ is then released. $\overline{CON}$ is an open collector signal. After power-up initialization, forcing $\overline{CON}$ low begins the configuration process.

$\overline{CS}$

Configuration enable pin. All configuration pins are ignored if $\overline{CS}$ is high. $\overline{CS}$ must be held low throughout the configuration process. $\overline{CS}$ is a TTL input pin.

M0, M1, M2

Configuration mode pins are used to determine the configuration mode. All three are TTL input pins.

CCLK

Configuration clock pin. CCLK is a TTL input or a CMOS output depending on the mode of operation. In modes 1, 2, 3, and 6 it is an input. In modes 4 and 5 it is an output with a typical frequency of 1 MHz. In all modes, the rising edge of the CCLK signal is used to sample inputs and change outputs.

CLOCK

External logic source used to drive the internal global clock line. Registers toggle on the rising edge of CLOCK. The CLOCK signal is neither used nor affected by the configuration modes. It is always a TTL input.

$\overline{RESET}$

Array register asynchronous reset. $\overline{RESET}$ drives the internal global reset. The $\overline{RESET}$ signal is neither used nor affected by the configuration modes. It is always a TTL input.

Dual-function Pins

When $\overline{CON}$ is high, dual-function I/O pins act as device I/Os; when $\overline{CON}$ is low, dual-function pins are used as configuration control or data signals as determined by the configuration modes. Care must be taken when using these pins to ensure that configuration activity does not interfere with other circuitry connected to these pins in the application.

D0 or I/O

Serial configuration modes use D0 as the serial data input pin. Parallel configuration modes use D0 as the least-significant bit. Input data must meet setup and hold requirements with respect to the rising edge of CCLK. D0 is a TTL input during configuration.

D1 to D7 or I/O

Parallel configuration modes use these pins as inputs. Serial configuration modes do not use them. Data must meet setup and hold requirements with respect to the rising edge of CCLK. D1 - D7 are TTL inputs during configuration.

A0 to A16 or I/O

During configuration in modes 1, 2 and 5, these pins are CMOS outputs and act as the address pins for a parallel EPROM. A0 - A16 eliminates the need for an external address counter when using an external parallel nonvolatile

memory to configure the FPGA. Addresses change after the rising edge of the CCLK signal.

$\overline{\text{CSOUT}}$ or I/O

When cascading devices, $\overline{\text{CSOUT}}$ is an output used to enable other devices. $\overline{\text{CSOUT}}$ should be connected to the $\overline{\text{CS}}$ input of the downstream device. The $\overline{\text{CSOUT}}$ function is optional and can be disabled during initial programming when cascading is not used. When cascading devices, $\overline{\text{CSOUT}}$ should be dedicated to configuration and not used as a configurable I/O.

$\overline{\text{CHECK}}$ or I/O

During configuration, $\overline{\text{CHECK}}$ is a TTL input that can be used to enable the data check function at the beginning of a configuration cycle. No data is written to the device while $\overline{\text{CHECK}}$ is low. Instead, the configuration file being applied to D0 (or D0 - D7, in parallel mode) is compared with the

current contents of the internal configuration RAM. If a mismatch is detected between the data being loaded and the data already in the RAM, the $\overline{\text{ERR}}$ pin goes low. The $\overline{\text{CHECK}}$ function is optional and can be disabled during initial programming.

$\overline{\text{ERR}}$ or I/O

During configuration, $\overline{\text{ERR}}$ is an output. When the $\overline{\text{CHECK}}$ function is activated and a mismatch is detected between the current configuration data stream and the data already loaded in the configuration RAM, $\overline{\text{ERR}}$ goes low. The $\overline{\text{ERR}}$ output is a registered signal. Once a mismatch is found, the signal is set and is only reset after the configuration cycle is restarted. $\overline{\text{ERR}}$ is also asserted for configuration file errors. The $\overline{\text{ERR}}$ function is optional and can be disabled during initial programming.

 3.  Obsolete. Not recommended for new design.

AC Timing Characteristics – 5V Operation

Delays are based on fixed load. Loads for each type of device are described in the notes. Delays are in nanoseconds. Worst case: $V_{CC} = 4.75V$ to $5.25V$. Temperature = $0^{\circ}C$ to $70^{\circ}C$.

Column Clock ⁽⁶⁾	Column Clock Driver	CLK	40 $\mu A/MHz$

- Notes:
1. TTL buffer delays are measured from a V_{IH} of 1.5V at the pad to the internal V_{IH} at A. The input buffer load is constant.
 2. CMOS buffer delays are measured from a V_{IH} of 1/2 V_{CC} at the pad to the internal V_{IH} at A. The input buffer load is constant.
 3. Buffer delay is to a pad voltage of 1.5V with one output switching.
 4. Max specifications are the average of t_{PDLH} and t_{PDHL} .
 5. Parameter based on characterization and simulation; not tested in production
 6. Exact power calculation is available in an Atmel application note.
 7. Load Definition: 1 = Load of one A or B input; 2 = Load of one L input; 3 = Constant Load; 4 = Tester Load of 50 pF.

AC Timing Characteristics – 3.3V Operation ⁽⁸⁾

Delays are based on fixed load. Loads for each type of device are described in the notes. Delays are in nanoseconds. Worst case: $V_{CC} = 3.0V$ to $3.6V$. Temperature = $0^{\circ}C$ to $70^{\circ}C$.

- Notes:
1. TTL buffer delays are measured from a V_{IH} of 1.5V at the pad to the internal V_{IH} at A. The input buffer load is constant.
 2. CMOS buffer delays are measured from a V_{IH} of 1/2 V_{CC} at the pad to the internal V_{IH} at A. The input buffer load is constant.
 3. Buffer delay is to a pad voltage of 1.5V with one output switching.
 4. Max specifications are the average of t_{PDLH} and t_{PDHL} .
 5. Parameter based on characterization and simulation; not tested in production
 6. Exact power calculation is available in an Atmel application note.
 7. Load Definition: 1 = Load of one A or B input; 2 = Load of one L input; 3 = Constant Load; 4 = Load of 28 Clock Columns; 5 = Load of 28 Reset Columns; 6 = Tester Load of 50 pF.
 8.  Obsolete. Not recommended for new design.

Absolute Maximum Ratings*

Supply Voltage (V_{CC})	-0.5V to + 7.0V
DC Input Voltage (V_{IN})	-0.5V to $V_{CC} + 0.5V$
DC Output Voltage (V_{ON})	-0.5V to $V_{CC} + 0.5V$
Storage Temperature Range (TSTG)	-65°C to +150°C
Power Dissipation (PD)	1500 mW
Lead Temperature (T_L) (Soldering, 10 sec.)	260°C
ESD ($R_{ZAP} = 1.5K$, $C_{ZAP} = 100$ pF)	2000V

*NOTICE: Stresses beyond those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. These are stress rating only and functional operation of the device at these or any other conditions beyond those listed under operating conditions is not implied. Exposure to Absolute Maximum Rating conditions for extended periods of time may affect device reliability.

	Output Leakage Current					
I _{OZL}	High-level Tristate	Without Pull-up, V _O = V _{SS}		-10		μA
	Output Leakage Current	With Pull-up, V _O = V _{SS}		-500		μA
I _{IH}	High-level Input Current	V _{IN} = V _{CC} (max)			10	μA
I _{IL}	Low-level Input Current	Without Pull-up, V _{IN} = V _{SS}		-10		μA
		With Pull-up, V _{IN} = V _{SS}		-500		μA
I _{CC}	Power Consumption	Without Internal Oscillator (Standby)			500	μA
C _{IN}	Input Capacitance	All Pins			10	pF

Note: 1.  Obsolete. Not recommended for new design.

DC Characteristics – 3.3V Operation⁽²⁾

Symbol	Parameter	Conditions	Min	Max	Units
V_{IH}	High-level Input Voltage	Commercial	CMOS	70% V_{CC}	V
			TTL	2.0	V
V_{IL}	Low-level Input Voltage	Commercial	CMOS	0	30% V_{CC}
			TTL	0	0.8
V_{OH}	High-level Output Voltage	Commercial	$I_{OH} = -2 \text{ mA}, V_{CC} \text{ min}$	2.4	V
			$I_{OH} = -6 \text{ mA}, V_{CC} \text{ min}$	2.0	V
V_{OL}	Low-level Output Voltage	Commercial	$I_{OL} = +2 \text{ mA}, V_{CC} \text{ min}$	0.4	V
			$I_{OL} = +6 \text{ mA}, V_{CC} \text{ min}$	0.5	V
I_{OZH}	High-level Tristate	$V_O = V_{CC} \text{ (max)}$		10	μA
	Output Leakage Current				
I_{OZL}	High-level Tristate	Without Pull-up, $V_O = V_{SS}$	-10		μA
	Output Leakage Current	With Pull-up, $V_O = V_{SS}$	-500		μA
I_{IH}	High-level Input Current	$V_{IN} = V_{CC} \text{ (max)}$		10	μA
I_{IL}	Low-level Input Current	Without Pull-up, $V_{IN} = V_{SS}$	-10		μA
		With Pull-up, $V_{IN} = V_{SS}$	-500		μA
I_{CC}	Power Consumption	Without Internal Oscillator (Standby)		200	μA
$C_{IN}^{(1)}$	Input Capacitance	All Pins		10	pF

Notes: 1. Parameter based on characterization and simulation; it is not tested in production.

2. Obsolete. Not recommended for new design.

Device Timing: During Operation

Ordering Information – AT6002⁽¹⁾

Usable Gates	Speed Grade (ns)	Ordering Code	Package	Operation Range
6,000	2	AT6002-2AC	100A	5V Commercial (0°C to 70°C)
		AT6002A-2AC	144A	
		AT6002-2JC	84J	
		AT6002-2QC	132Q	
		AT6002-2AI	100A	5V Industrial (-40°C to 85°C)
		AT6002A-2AI	144A	
		AT6002-2JI	84J	
		AT6002-2QI	132Q	
6,000	4	AT6002-4AC	100A	5V Commercial (0°C to 70°C)

Revision History

Doc. No.	Date	Description
0264G	04/2015	Obsoleted AT6002, AT6003, and all AT6K low voltage (LV) devices and the AT6005 and AT6010A lead based packages. Added lead free packages options for AT6005 and AT6010A devices.
0264F	10/2009
