What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Active
Core Processor	AVR
Core Size	8-Bit
Speed	20MHz
Connectivity	I²C, SPI, UART/USART
Peripherals	Brown-out Detect/Reset, POR, PWM, WDT
Number of I/O	32
Program Memory Size	32KB (16K x 16)
Program Memory Type	FLASH
EEPROM Size	1K x 8
RAM Size	2K x 8
Voltage - Supply (Vcc/Vdd)	1.8V ~ 5.5V
Data Converters	A/D 8x10b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 85°C (TA)
Mounting Type	Surface Mount
Package / Case	49-VFBGA
Supplier Device Package	49-VFBGA (5x5)

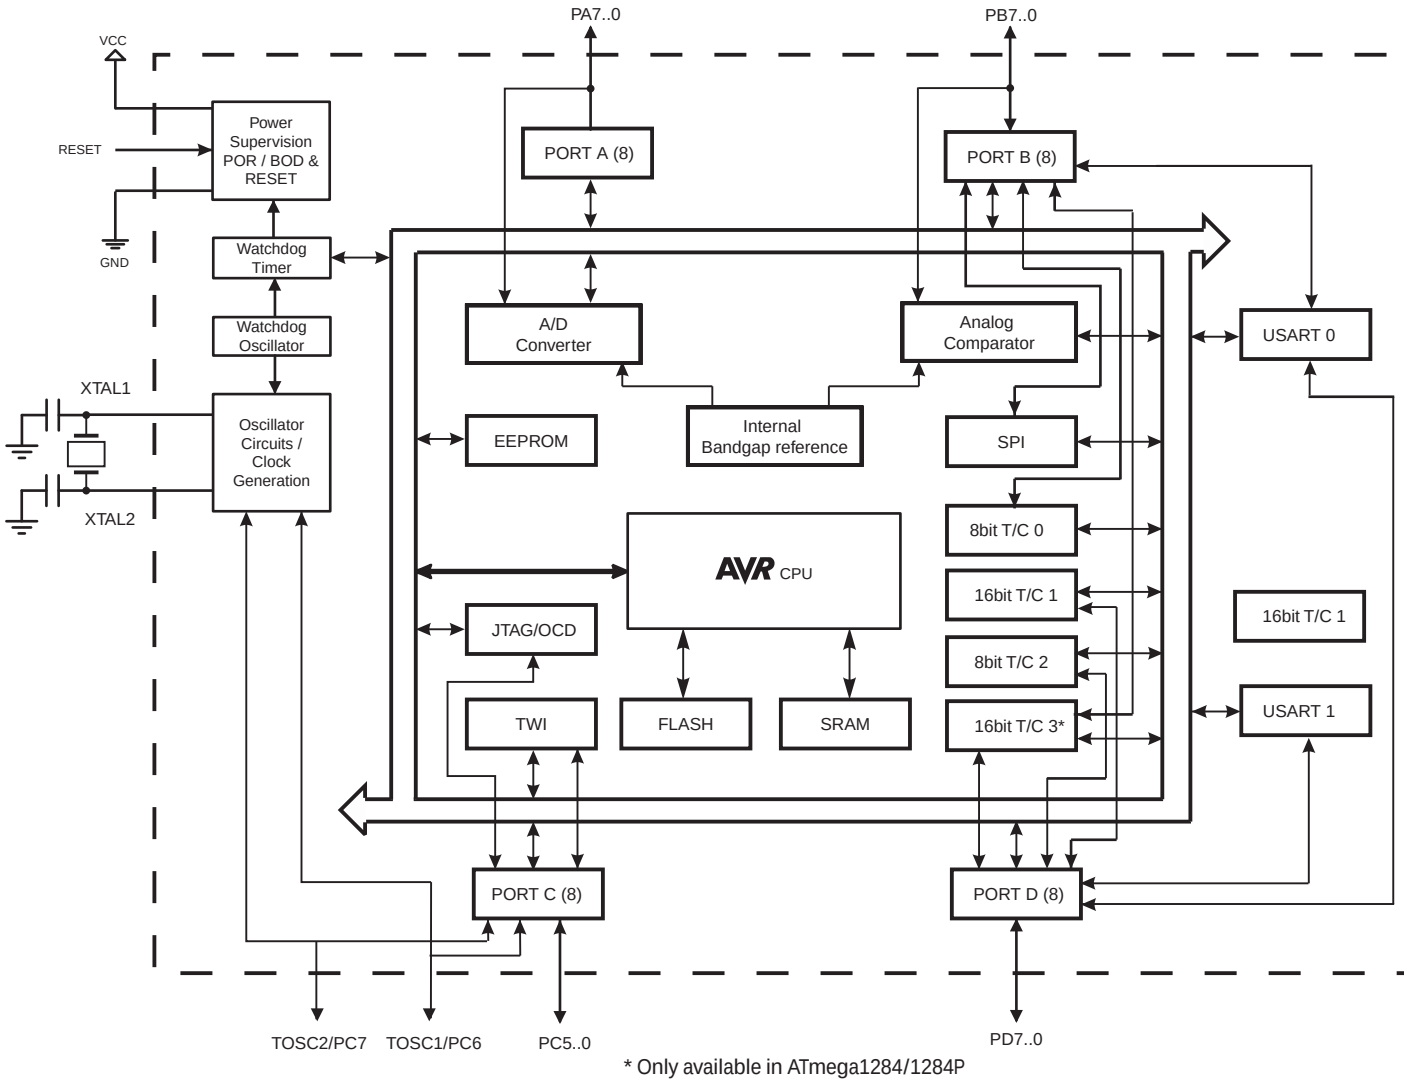
2.1 Block diagram

Figure 2-1. Block diagram.



The AVR core combines a rich instruction set with 32 general purpose working registers. All the 32 registers are directly connected to the Arithmetic Logic Unit (ALU), allowing two independent registers to be accessed in one single instruction executed in one clock cycle. The resulting architecture is more code efficient while achieving throughputs up to ten times faster than conventional CISC microcontrollers.

The Atmel ATmega164A/164PA/324A/324PA/644A/644PA/1284/1284P provide the following features:

16/32/64/128Kbytes of In-System Programmable Flash with Read-While-Write capabilities, 512/1K/2K/4Kbytes EEPROM, 1/2/4/16Kbytes SRAM, 32 general purpose I/O lines, 32 general purpose working registers, Real Time Counter (RTC), three (four for ATmega1284/1284P) flexible Timer/Counters with compare modes and PWM, 2 USARTs, a byte oriented two-wire Serial Interface, a 8-channel, 10-bit ADC with optional differential input stage with programmable gain, programmable Watchdog Timer with Internal Oscillator, an SPI serial port, IEEE std. 1149.1 compliant JTAG test interface, also used for accessing the On-chip Debug system and programming and six software selectable power saving modes. The Idle mode stops the CPU while allowing the SRAM, Timer/Counters, SPI port, and interrupt system to continue functioning. The Power-down mode saves the register contents but freezes the Oscillator, disabling all other chip functions until the next interrupt or Hardware Reset. In Power-save mode, the asynchronous timer continues to run, allowing the user to maintain a

2.3.3 Port A (PA7:PA0)

Port A serves as analog inputs to the Analog-to-digital Converter.
Port A also serves as an 8-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port A output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port A pins that are externally pulled low will source current if the pull-up resistors are activated. The Port A pins are tri-stated when a reset condition becomes active, even if the clock is not running.
Port A also serves the functions of various special features of the Atmel ATmega164A/164PA/324A/324PA/644A/644PA/1284/1284P as listed on page 79.

2.3.4 Port B (PB7:PB0)

Port B is an 8-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port B output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port B pins that are externally pulled low will source current if the pull-up resistors are activated. The Port B pins are tri-stated when a reset condition becomes active, even if the clock is not running.
Port B also serves the functions of various special features of the ATmega164A/164PA/324A/324PA/644A/644PA/1284/1284P as listed on page 80.

2.3.5 Port C (PC7:PC0)

Port C is an 8-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port C output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port C pins that are externally pulled low will source current if the pull-up resistors are activated. The Port C pins are tri-stated when a reset condition becomes active, even if the clock is not running.
Port C also serves the functions of the JTAG interface, along with special features of the Atmel ATmega164A/164PA/324A/324PA/644A/644PA/1284/1284P as listed on page 83.

2.3.6 Port D (PD7:PD0)

Port D is an 8-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port D output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port D pins that are externally pulled low will source current if the pull-up resistors are activated. The Port D pins are tri-stated when a reset condition becomes active, even if the clock is not running.
Port D also serves the functions of various special features of the ATmega164A/164PA/324A/324PA/644A/644PA/1284/1284P as listed on page 86.

2.3.7 $\overline{\text{RESET}}$

Reset input. A low level on this pin for longer than the minimum pulse length will generate a reset, even if the clock is not running. The minimum pulse length is given in "" on page 325. Shorter pulses are not guaranteed to generate a reset.

2.3.8 XTAL1

Input to the inverting Oscillator amplifier and input to the internal clock operating circuit.

2.3.9 XTAL2

Output from the inverting Oscillator amplifier.

2.3.10 AVCC

AVCC is the supply voltage pin for Port A and the Analog-to-digital Converter. It should be externally connected to V_{CC}, even if the ADC is not used. If the ADC is used, it should be connected to V_{CC} through a low-pass filter.

2.3.11 AREF

This is the analog reference pin for the Analog-to-digital Converter.

4. About code examples

This documentation contains simple code examples that briefly show how to use various parts of the device. Be aware that not all C compiler vendors include bit definitions in the header files and interrupt handling in C is compiler dependent. Please confirm with the C compiler documentation for more details.

The code examples assume that the part specific header file is included before compilation. For I/O registers located in extended I/O map, "IN", "OUT", "SBIS", "SBIC", "CBI", and "SBI" instructions must be replaced with instructions that allow access to extended I/O. Typically "LDS" and "STS" combined with "SBRS", "SBRC", "SBR", and "CBR".

5. Data retention

Reliability Qualification results show that the projected data retention failure rate is much less than 1 PPM over 20 years at 85°C or 100 years at 25°C.

6. Capacitive touch sensing

The Atmel QTouch Library provides a simple to use solution to realize touch sensitive interfaces on most Atmel AVR microcontrollers. The QTouch Library includes support for the QTouch and QMatrix acquisition methods.

Touch sensing can be added to any application by linking the appropriate Atmel QTouch Library for the AVR Microcontroller. This is done by using a simple set of APIs to define the touch channels and sensors, and then calling the touch sensing API's to retrieve the channel information and determine the touch sensor states.

The QTouch Library is FREE and downloadable from the Atmel website at the following location: www.atmel.com/qtouchlibrary. For implementation details and other information, refer to the Atmel QTouch Library User Guide - also available for download from the Atmel website.

Notes:
1. For compatibility with future devices, reserved bits should be written to zero if accessed. Reserved I/O memory addresses should never be written.
2. I/O registers within the address range $00 - $1F are directly bit-accessible using the SBI and CBI instructions. In these registers, the value of single bits can be checked by using the SBIS and SBIC instructions.
3. Some of the status flags are cleared by writing a logical one to them. Note that the CBI and SBI instructions will operate on all bits in the I/O register, writing a one back into any flag read as set, thus clearing the flag. The CBI and SBI instructions work with registers 0x00 to 0x1F only.
4. When using the I/O specific commands IN and OUT, the I/O addresses $00 - $3F must be used. When addressing I/O registers as data space using LD and ST instructions, $20 must be added to these addresses. The ATmega164A/164PA/324A/324PA/644A/644PA/1284/1284P is a complex microcontroller with more peripheral units than can be supported within the 64 location reserved in Opcode for the IN and OUT instructions. For the Extended I/O space from $60 - $FF, only the ST/STS/STD and LD/LDS/LDD instructions can be used.
5. USART in SPI Master Mode.
6. Only available in the ATmega164PA/324PA/644PA/1284P.
7. Only available in the ATmega1284/1284P

12. Datasheet revision history

Please note that the referring page numbers in this section are referred to this document. The referring revision in this section are referring to the document revision.

12.1 Rev. 8272G - 01/2015

1.	Updated Table 1-2 on page 5, Table 8-1 on page 25, Table 10-1 on page 42, Table 14-3 on page 79, Table 19-4 on page 187, Table 19-11 on page 192 and Table 28-16 on page 328 for formatting consistency errors
2.	Updated ”Ordering information” on page 17: – Added ordering information for ATmega164PA @105°C; ATmega324PA @ 105°C; ATmega324PA @105°C; ATmega644PA @ 105°C and ATmega1284P @ 105°C
3.	Updated the ”Packaging information” on page 25: – Replaced the drawing ”44M1” on page 27 by a correct package

12.2 Rev. 8272F - 08/2014

1.	Updated text in Section 13.2.8 ”PCMSK1 – Pin Change Mask Register 1” on page 70 to: “If PCINT15:8 is set and the PCIE1 bit in PCICR is set, pin change interrupt is enabled on the corresponding I/O pin.”
2.	Corrected description of PAGEMSB in Table 26-9 on page 281. The device has 64 words in a page and not 128.
3.	Corrected description of PAGEMSB in Table 26-12 on page 282. PAGESMB is 5 and the device has 64 words in a page and not 128. The page require six bits and not seven.
4.	Corrected values in Table 26-16 on page 284. PAGEMSB is 6. ZPAGEMSB is Z7 and PCPAGE is Z15:Z8
5.	Corrected value for PCPAGE in Table 27-7 on page 290. The correct value is PC[14:7]
6.	Updated description in Table 17-2 on page 151 to “Normal port operation, OC2A disconnected.”
7.	Updated Assembly code examples on for ”Watchdog Timer” on page 55. and onwards “out WDTCSR, r16” changed to “sts WDTCSR, r16” “in r16, WDTCSR” changed to “lds r16, WDTCSR” “idi r16, WDTCSR” changed to “lds r16, WDTCSR”
8.	Updated addresses 0x65 and 0x64 in Section 7. ”Register summary” on page 10.
9.	Removed notes 5 and 6 from Table 28-16 on page 328.
10.	Corrected values in Section 8. ”Instruction set summary” on page 14.Changed clock values for RCALL and ICALL to 2, for Call, Ret and RETI to 4. Also changed values in Section 7.7.1 ”Interrupt response time” on page 18.
11.	Updated layout, footer and back page according to template 0205/2014

12.3 Rev. 8272E - 04/2013

1.	Updated Figure 1-1 on page 3 and Figure 2-1 on page 6: T3 and T/C3 only available in ATmega1284/1284P.
2.	Updated descriptive text on page 6 to indicate that ATmega1284/1284P has four T/Cs.
3.	Updated the Assembly code example for WDT_off (p.56) following the ej# 705736.
4.	Added note in ”16-bit Timer/Counter1 and Timer/Counter3(1) with PWM” on page 107.
5.	Added ”Prescaler Reset” on page 112.
6.	Corrected three typo for Waveform generation mode (WGM) instead of MGM.
7.	Updated Table 23-6 on page 253. ADC Auto Trigger Source Selections, ADTS=0b011, the statement is Timer/Counter0 Compare Match A.
8.	Updated Table 27-18 on page 310. Command for 6d Poll for Fuse Write Complete: 0111011_00000000
9.	Updated the table notes of the Table 28-1 on page 318.
10.	Updated ”Register summary” on page 10. Added table note 7: Only available in ATmega1284/1284P.

12.4 Rev. 8272D - 05/12

1.	Updated ”Power-down mode” on page 44.
2.	Updated ”Overview” on page 67.
3.	Corrected references for Bit 2, Bit 1, and Bit 0 in Section ”UCSRnC – USART MSPIM Control and Status Register n C” on page 201.
4.	Several small corrections throughout the whole document made according to the template
5.	Notes in Table 27-17 on page 304 have been corrected
6.	Note (1) in Table 28-3 on page 320 is added

12.5 Rev. 8272C - 06/11

1.	Updated ”Atmel ATmega1284P DC characteristics” on page 323.

12.6 Rev. 8272B - 05/11

1.	Added Atmel QTouch Library Support and QTouch Sensing Capability Features.
2.	Replaced the Figure 1-1 on page 3 by an updated “Pinout.” that includes Timer/Counter3.
3.	Replaced the Figure 7-1 on page 10 by an updated “Block diagram of the AVR architecture.” that includes Timer/Counter3.
4.	Added ”RAMPZ – Extended Z-pointer Register for ELPM/SPM(1)” on page 15.
5.	Added ”PRR1 – Power Reduction Register 1” on page 49.
6.	Renamed PRR to ”PRR0 – Power Reduction Register 0” on page 48.
7.	Updated ”PCIFR – Pin Change Interrupt Flag Register” on page 69. PCICR replaces EIMSR in the PCIF3, PCIF2, PCIF1 and PCIF0 bit description.
8.	Updated ”PCMSK3 – Pin Change Mask Register 3” on page 70. PCIE3 replaces PCIE2 in the bit description.
9.	Updated ”Alternate Functions of Port B” on page 80 to include Timer/Counter3
10.	Updated ”Alternate Functions of Port D” on page 86 to include Timer/Counter3
11.	Added ”TCNT3H and TCNT3L –Timer/Counter3” on page 132
