What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Active
Core Processor	AVR
Core Size	8-Bit
Speed	16MHz
Connectivity	I²C, SPI, UART/USART, USB
Peripherals	Brown-out Detect/Reset, POR, PWM, WDT
Number of I/O	26
Program Memory Size	32KB (16K x 16)
Program Memory Type	FLASH
EEPROM Size	1K x 8
RAM Size	2.5K x 8
Voltage - Supply (Vcc/Vdd)	2.7V ~ 5.5V
Data Converters	A/D 12x10b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 85°C (TA)
Mounting Type	Surface Mount
Package / Case	44-TQFP
Supplier Device Package	44-TQFP (10x10)

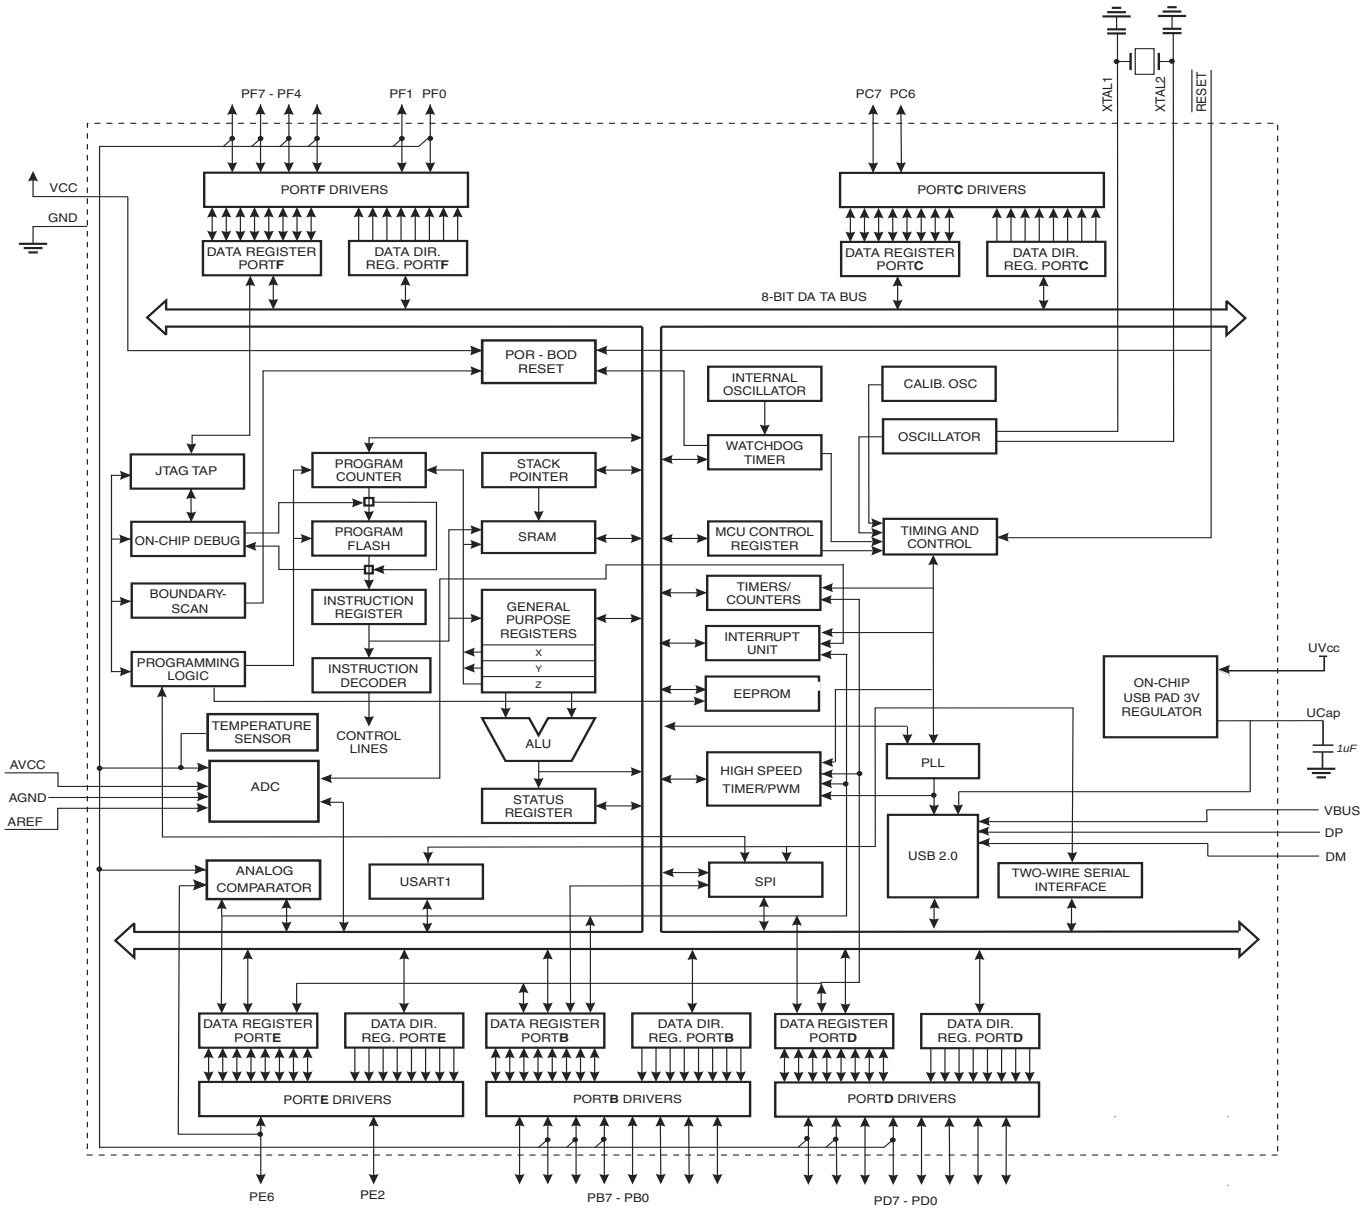
2. Overview

The ATmega16U4/ATmega32U4 is a low-power CMOS 8-bit microcontroller based on the AVR enhanced RISC architecture. By executing powerful instructions in a single clock cycle, the device achieves throughputs approaching 1 MIPS per MHz allowing the system designer to optimize power consumption versus processing speed.

2.1 Block Diagram

Figure 2-1. Block Diagram



The AVR core combines a rich instruction set with 32 general purpose working registers. All the 32 registers are directly connected to the Arithmetic Logic Unit (ALU), allowing two independent registers to be accessed in one single instruction executed in one clock cycle. The resulting architecture is more code efficient while achieving throughputs up to ten times faster than conventional CISC microcontrollers.

The device provides the following features: 16/32K bytes of In-System Programmable Flash with Read-While-Write capabilities, 512Bytes/1K bytes EEPROM, 1.25/2.5K bytes SRAM, 26 general purpose I/O lines (CMOS outputs and LVTTL inputs), 32 general purpose working registers, four flexible Timer/Counters with compare modes and PWM, one more high-speed Timer/Counter with compare modes and PLL adjustable source, one USART (including CTS/RTS flow control signals), a byte oriented 2-wire Serial Interface, a 12-channels 10-bit ADC with optional differential input stage with programmable gain, an on-chip calibrated temperature sensor, a programmable Watchdog Timer with Internal Oscillator, an SPI serial port, IEEE std. 1149.1 compliant JTAG test interface, also used for accessing the On-chip Debug system and programming and six software selectable

power saving modes. The Idle mode stops the CPU while allowing the SRAM, Timer/Counters, SPI port, and interrupt system to continue functioning. The Power-down mode saves the register contents but freezes the Oscillator, disabling all other chip functions until the next interrupt or Hardware Reset. The ADC Noise Reduction mode stops the CPU and all I/O modules except ADC, to minimize switching noise during ADC conversions. In Standby mode, the Crystal/Resonator Oscillator is running while the rest of the device is sleeping. This allows very fast start-up combined with low power consumption.

The device is manufactured using the Atmel® high-density nonvolatile memory technology. The On-chip ISP Flash allows the program memory to be reprogrammed in-system through an SPI serial interface, by a conventional nonvolatile memory programmer, or by an On-chip Boot program running on the AVR core. The boot program can use any interface to download the application program in the application Flash memory. Software in the Boot Flash section will continue to run while the Application Flash section is updated, providing true Read-While-Write operation. By combining an 8-bit RISC CPU with In-System Self-Programmable Flash on a monolithic chip, the device is a powerful microcontroller that provides a highly flexible and cost effective solution to many embedded control applications.

The ATmega16U4/ATmega32U4 AVR is supported with a full suite of program and system development tools including: C compilers, macro assemblers, program debugger/simulators, in-circuit emulators, and evaluation kits.

2.2 Pin Descriptions

2.2.1 VCC

Digital supply voltage.

2.2.2 GND

Ground.

2.2.3 Port B (PB7..PB0)

Port B is an 8-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port B output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port B pins that are externally pulled low will source current if the pull-up resistors are activated. The Port B pins are tri-stated when a reset condition becomes active, even if the clock is not running.

Port B has better driving capabilities than the other ports.

Port B also serves the functions of various special features of the device as listed on page 74.

2.2.4 Port C (PC7,PC6)

Port C is an 8-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port C output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port C pins that are externally pulled low will source current if the pull-up resistors are activated. The Port C pins are tri-stated when a reset condition becomes active, even if the clock is not running.

Only bits 6 and 7 are present on the product pinout.

Port C also serves the functions of special features of the device as listed on page 77.

2.2.5 Port D (PD7..PD0)

Port D is an 8-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port D output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port D pins that are externally pulled low will source current if the pull-up resistors are activated. The Port D pins are tri-stated when a reset condition becomes active, even if the clock is not running.

Port D also serves the functions of various special features of the ATmega16U4/ATmega32U4 as listed on page 78.

2.2.6 Port E (PE6,PE2)

Port E is an 8-bit bi-directional I/O port with internal pull-up resistors (selected for each bit). The Port E output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port E pins that are externally pulled low will source current if the pull-up resistors are activated. The Port E pins are tri-stated when a reset condition becomes active, even if the clock is not running.

Only bits 2 and 6 are present on the product pinout.

Port E also serves the functions of various special features of the ATmega16U4/ATmega32U4 as listed on page 81.

2.2.7 Port F (PF7..PF4, PF1,PF0)

Port F serves as analog inputs to the A/D Converter.

Port F also serves as an 8-bit bi-directional I/O port, if the A/D Converter channels are not used. Port pins can provide internal pull-up resistors (selected for each bit). The Port F output buffers have symmetrical drive characteristics with both high sink and source capability. As inputs, Port F pins that are externally pulled low will source current if the pull-up resistors are activated. The Port F pins are tri-stated when a reset condition becomes active, even if the clock is not running.

Bits 2 and 3 are not present on the product pinout.

Port F also serves the functions of the JTAG interface. If the JTAG interface is enabled, the pull-up resistors on pins PF7(TDI), PF5(TMS), and PF4(TCK) will be activated even if a reset occurs.

2.2.8 D-

USB Full speed / Low Speed Negative Data Upstream Port. Should be connected to the USB D- connector pin with a serial 22Ω resistor.

2.2.9 D+

USB Full speed / Low Speed Positive Data Upstream Port. Should be connected to the USB D+ connector pin with a serial 22Ω resistor.

2.2.10 UGND

USB Pads Ground.

2.2.11 UVCC

USB Pads Internal Regulator Input supply voltage.

2.2.12 UCAP

USB Pads Internal Regulator Output supply voltage. Should be connected to an external capacitor (1µF).

2.2.13 VBUS

USB VBUS monitor input.

2.2.14 $\overline{\text{RESET}}$

Reset input. A low level on this pin for longer than the minimum pulse length will generate a reset, even if the clock is not running. The minimum pulse length is given in Table 8-2 on page 53. Shorter pulses are not guaranteed to generate a reset.

2.2.15 XTAL1

Input to the inverting Oscillator amplifier and input to the internal clock operating circuit.

2.2.16 XTAL2

Output from the inverting Oscillator amplifier.

2.2.17 AVCC

AVCC is the supply voltage pin (input) for all the A/D Converter channels. If the ADC is not used, it should be externally connected to V_{CC}. If the ADC is used, it should be connected to V_{CC} through a low-pass filter.

2.2.18 AREF

This is the analog reference pin (input) for the A/D Converter.

3. About

3.1 Disclaimer

Typical values contained in this datasheet are based on simulations and characterization of other AVR microcontrollers manufactured on the same process technology. Min. and Max. values will be available after the device is characterized.

3.2 Resources

A comprehensive set of development tools, application notes and datasheets are available for download on http://www.atmel.com/avr.

3.3 Code Examples

This documentation contains simple code examples that briefly show how to use various parts of the device. Be aware that not all C compiler vendors include bit definitions in the header files and interrupt handling in C is compiler dependent. Confirm with the C compiler documentation for more details.

These code examples assume that the part specific header file is included before compilation. For I/O registers located in extended I/O map, "IN", "OUT", "SBIS", "SBIC", "CBI", and "SBI" instructions must be replaced with instructions that allow access to extended I/O. Typically "LDS" and "STS" combined with "SBRS", "SBRC", "SBR", and "CBR".

3.4 Data Retention

Reliability Qualification results show that the projected data retention failure rate is much less than 1PPM over 20 years at 85°C or 100 years at 25°C.

Note:
1. For compatibility with future devices, reserved bits should be written to zero if accessed. Reserved I/O memory addresses should never be written.
2. I/O registers within the address range $00 - $1F are directly bit-accessible using the SBI and CBI instructions. In these registers, the value of single bits can be checked by using the SBIS and SBIC instructions.
3. Some of the status flags are cleared by writing a logical one to them. Note that the CBI and SBI instructions will operate on all bits in the I/O register, writing a one back into any flag read as set, thus clearing the flag. The CBI and SBI instructions work with registers 0x00 to 0x1F only.
4. When using the I/O specific commands IN and OUT, the I/O addresses $00 - $3F must be used. When addressing I/O registers as data space using LD and ST instructions, $20 must be added to these addresses. The ATmega16U4/ATmega32U4 is a complex microcontroller with more peripheral units than can be supported within the 64 location reserved in Opcode for the IN and OUT instructions. For the Extended I/O space from $60 - $1FF in SRAM, only the ST/STS/STD and LD/LDS/LDD instructions can be used.

6. Ordering Information

6.1 ATmega16U4

Speed [MHz]	Power Supply	Ordering Code	Default Oscillator	Package	Operation Range
16	2.7 - 5.5V	ATmega16U4-AU	External XTAL	44ML	Industrial (-40° to +85°C)
		ATmega16U4RC-AU	Internal Calib. RC		
		ATmega16U4-MU (1)(2)(3)	External XTAL	44PW	
		ATmega16U4RC-MU (1)(2)(3)	Internal Calib. RC		

Notes:
1. For more information on running the USB from internal RC oscillator consult application note AVR291: 8MHz Internal Oscillator Calibration for USB Low Speed on Atmel ATmega32U4RC.
2. USB operation from internal RC oscillator is only guaranteed for 0°C to 40°C.
3. These parts are shipped with no USB bootloader pre-programmed.

Package Type	
44ML	ML, 44 - Lead, 10 x 10mm Body Size, 1.0mm Body Thickness 0.8mm Lead Pitch, Thin Profile Plastic Quad Flat Package (TQFP)
44PW	PW, 44 - Lead 7.0 x 7.0mm Body, 0.50mm Pitch Quad Flat No Lead Package (QFN)

If a pending interrupt cannot wake the part up from the selected mode, the current consumption will increase during sleep when executing the SLEEP instruction directly after a SEI instruction.

Problem Fix/work around

Before entering sleep, interrupts not used to wake up the part from the sleep mode should be disabled.

3. **Increased power consumption in power-down mode**

   The typical power consumption is increased by about 30 µA in power-down mode.

   Problem Fix/work around

   None.

4. **Internal RC oscillator start up may fail**

   When the part is configured to start on internal RC oscillator, the oscillator may not start properly after power-on.

   Problem Fix/work around

   Do not configure the part to start on internal RC oscillator.

5. **Internal RC oscillator calibration**

   8 MHz frequency can be impossible to reach with internal RC even when using maximal OSCAL value.

   Problem Fix/work around

   None.

6. **Incorrect execution of VBUSTI interrupt**

   The CPU may incorrectly execute the interrupt vector related to the VBUSTI interrupt flag.

   Problem fix/work around

   Do not enable this interrupt. Firmware must process this USB event by polling VBUSTI.

7. **Timer 4 11-bits enhanced PWM mode**

   Timer 4 11-bits enhanced mode is not functional.

   Problem Fix/work around

   None.

9.4 Rev. 7766G – 02/2014

1.	Updated the “Description” on page 177 of the “Output Compare Modulator (OCM1C0A)” . Specified when the logical AND and the logical OR will be performed based on the PORTB7.
2.	Updated “USART Control and Status Register n D– UCSRnD” on page 213. “Bits 7:2 - Reserved” are Read only.
3.	Updated “Crystal-less Operation” on page 259. The temperature range changed to “within the 0°C and +40°C.
4.	MUX bit in “ADC Control and Status Register B – ADCSRB” on page 294 changed to R/W.
5.	Updated Table 24-6 on page 318. Trigger Source: Timer/Counter0 Compare Match updated to Timer/Counter0 Compare Match A.
6.	Updated “DC Characteristics” on page 383. Added Active 16MHz, V_{CC} = 5V, max. 27mA, in “Icc / Power supply current”.
7.	Updated “Register Summary” on page 9. Added UCSRnD at the address CBh.
8.	Replaced the “TQFP44” on page 18 and “QFN44” on page 19 by updated package drawings.
9.	Updated the last page according to Atmel new Brand Style Guide (new logo).

9.5 Rev. 7766F – 11/10

1.	Replaced the “QFN44” on page 19 by an updated drawing.
2.	Updated “ADC Control and Status Register B – ADCSRB” on page 294. Defined the ADCSRB register as in “ADC Control and Status Register B – ADCSRB” on page 317.
3.	Updated the last page according to Atmel new Brand Style Guide.

9.6 Rev. 7766E – 04/10

1.	Updated “Features” on page 1.
2.	Updated “Features” on page 256.
3.	Updated Figure 21-9 on page 261.
4.	Updated Section 21.8 on page 263.
5.	Updated “Features” on page 297.
6.	Updated “Boundary-scan Order” on page 332.
7.	Updated “Program And Data Memory Lock Bits” on page 353.
8.	Updated Table 28-5 on page 355.
9.	Updated “Electrical Characteristics” on page 383.
10.	Updated Figure 29-2 on page 386.

11.	Added “Typical Characteristics” on page 392.
12.	Updated “Ordering Information” on page 16.
13.	Updated “Errata” on page 21.

9.7 Rev. 7766D – 01/09

1.	Updated Memory section in “Features” on page 1.
2.	Added section “Resources” on page 8.
3.	Added section “Data Retention” on page 8.
4.	Updated “Ordering Information” on page 16.

9.8 Rev. 7766C – 11/08

1.	Updated Memory section in “Features” on page 1.

9.9 Rev. 7766B – 11/08

1.	Added ATmega16U4 device.
2.	Created errata section and added ATmega16U4.
3.	Updated High Speed Timer, asynchronous description Section 15. on page 139

9.10 Rev. 7766A – 07/08
