Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Not For New Designs
Core Processor	ColdFire V2
Core Size	32-Bit Single-Core
Speed	80MHz
Connectivity	I²C, SPI, UART/USART
Peripherals	DMA, LVD, POR, PWM, WDT
Number of I/O	55
Program Memory Size	64KB (64K x 8)
Program Memory Type	FLASH
EEPROM Size	-
RAM Size	16K x 8
Voltage - Supply (Vcc/Vdd)	3V ~ 3.6V
Data Converters	A/D 8x12b
Oscillator Type	External, Internal
Operating Temperature	-40°C ~ 85°C (TA)
Mounting Type	Surface Mount
Package / Case	81-LBGA
Supplier Device Package	81-MAPBGA (10x10)
Purchase URL	https://www.e-xfl.com/product-detail/nxp-semiconductors/mcf52100cvm80

1 Family Configurations

Table 1. MCF52110 Family Configurations

Module	52100	52110
ColdFire Version 2 Core with MAC (Multiply-Accumulate Unit)	•	•
System Clock	66, 80 MHz	
Performance (Dhrystone 2.1 MIPS)	up to 76	
Flash/Static RAM (SRAM)	64/16 Kbytes	128/16 Kbytes
Interrupt Controller (INTC)	•	•
Fast Analog-to-Digital Converter (ADC)	•	•
Real-Time Clock (RTC)	•	•
Four-channel Direct-Memory Access (DMA)	•	•
Software Watchdog Timer (WDT)	•	•
Backup Watchdog Timer	•	•
Two-channel Periodic Interrupt Timer (PIT)	2	2
Four-Channel General Purpose Timer (GPT)	•	•
32-bit DMA Timers	4	4
QSPI	•	•
UART(s)	2	3
I^2C	2	2
Eight/Four-channel 8/16-bit PWM Timer	•	•
General Purpose I/O Module (GPIO)	•	•
Chip Configuration and Reset Controller Module	•	•
Background Debug Mode (BDM)	•	•
JTAG - IEEE 1149.1 Test Access Port[1]	•	•
Package	64 LQFP/QFN 81 MAPBGA	64 LQFP/QFN 81 MAPBGA 100 LQFP

[1] The full debug/trace interface is available only on the 100-pin packages. A reduced debug interface is bonded on smaller packages.

1.1 Block Diagram

Figure 1 shows a top-level block diagram of the device. Package options for this family are described later in this document.

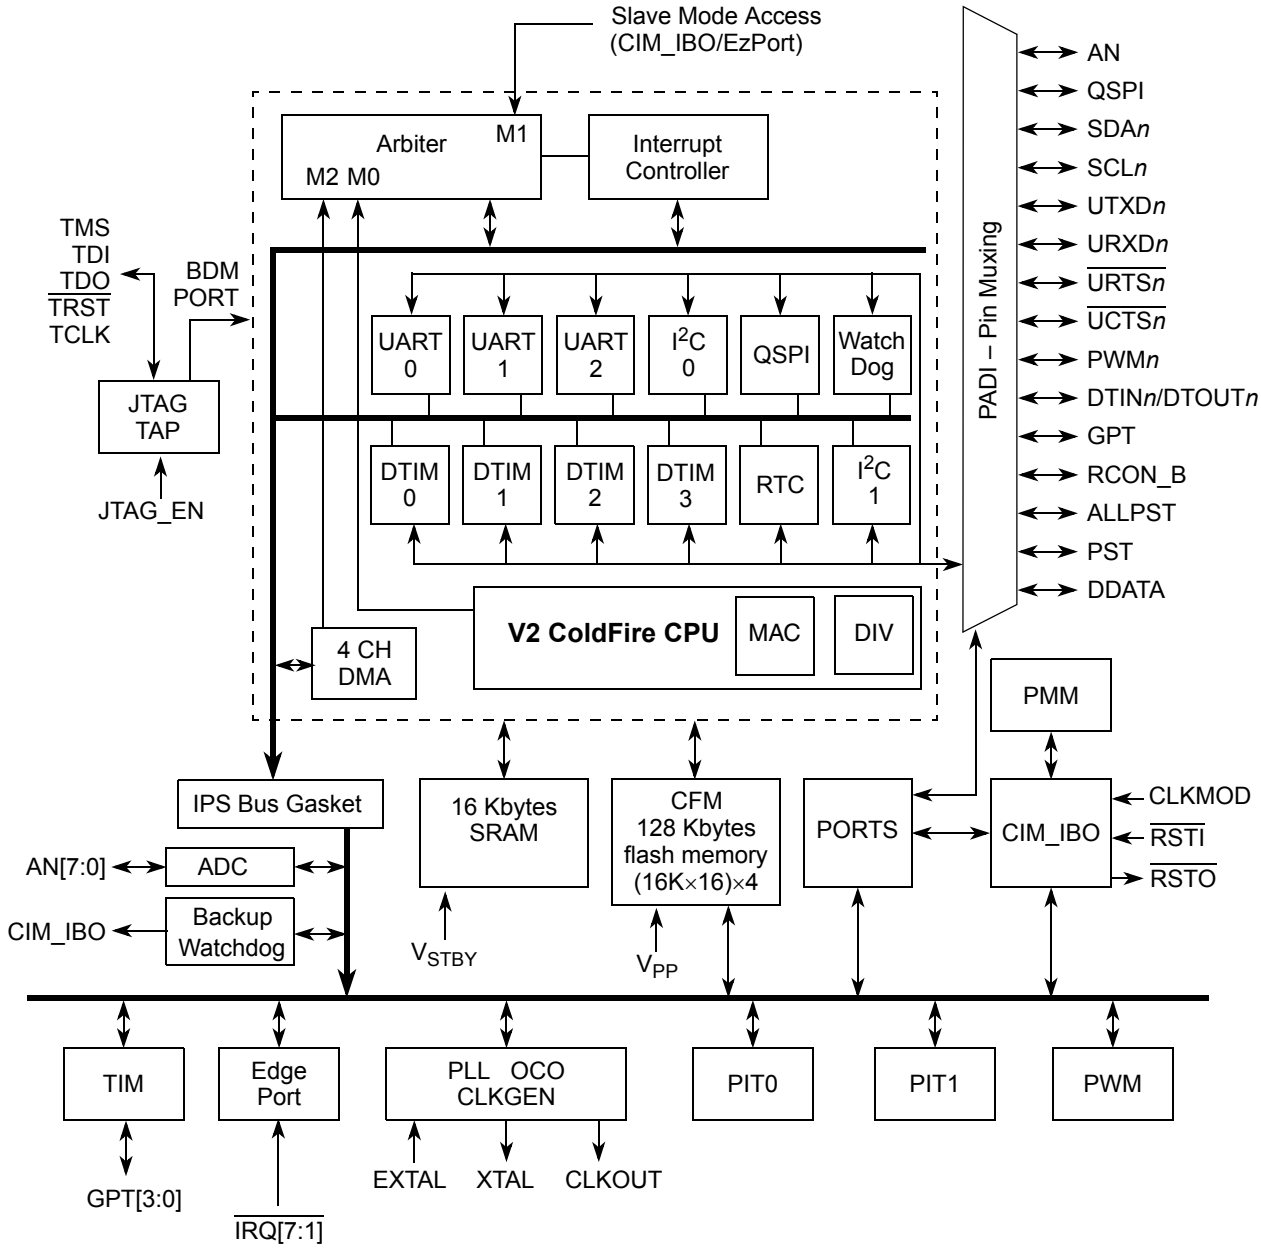

Figure 1. MCF52110 Block Diagram

1.2 Features

1.2.1 Feature Overview

The MCF52110 family includes the following features:

- Version 2 ColdFire variable-length RISC processor core
  - Static operation
  - 32-bit address and data paths on-chip
  - Up to 80 MHz processor core frequency
  - Up to 40 MHz andoff-chip bus frequency
  - Sixteen general-purpose, 32-bit data and address registers
  - Implements ColdFire ISA_A+. This is ISA_A with extensions to support the user stack pointer register and four new instructions for improved bit processing (ISA_A+)
  - Multiply-Accumulate (MAC) unit with 32-bit accumulator to support 16×16 → 32 or 32×32 → 32 operations
- System debug support
  - Real-time trace for determining dynamic execution path
  - Background debug mode (BDM) for in-circuit debugging (DEBUG_B+)
  - Real-time debug support, with six hardware breakpoints (4 PC, 1 address and 1 data) configurable into a 1- or 2-level trigger
- On-chip memories
  - 16-Kbyte dual-ported SRAM on CPU internal bus, supporting core and DMA access with standby power supply support
  - Up to 128 Kbytes of interleaved flash memory supporting 2-1-1-1 accesses
- Power management
  - Fully static operation with processor sleep and whole chip stop modes
  - Rapid response to interrupts from the low-power sleep mode (wake-up feature)
  - Programmable clock enable/disable for each peripheral when not used (except backup watchdog timer)
  - Software controlled disable of external clock output for low-power consumption
- Three universal asynchronous/synchronous receiver transmitters (UARTs)
  - 16-bit divider for clock generation
  - Interrupt control logic with maskable interrupts
  - DMA support
  - Data formats can be 5, 6, 7 or 8 bits with even, odd, or no parity
  - Up to two stop bits in 1/16 increments
  - Error-detection capabilities
  - Modem support includes request-to-send (RTS) and clear-to-send (CTS) lines for two UARTs
  - Transmit and receive FIFO buffers
- Two I^2C modules
  - Interchip bus interface for EEPROMs, LCD controllers, A/D converters, and keypads
  - Fully compatible with industry-standard I^2C bus
  - Master and slave modes support multiple masters
  - Automatic interrupt generation with programmable level
- Queued serial peripheral interface (QSPI)
  - Full-duplex, three-wire synchronous transfers
  - Up to four chip selects available
  - Master mode operation only
  - Programmable bit rates up to half the CPU clock frequency
  - Up to 16 pre-programmed transfers
- Fast analog-to-digital converter (ADC)
  - Eight analog input channels
  - 12-bit resolution

- Clock generation features
  - Crystal, on-chip trimmed relaxation oscillator, or external oscillator reference options
  - Trimmed relaxation oscillator
  - Pre-divider capable of dividing the clock source frequency into the PLL reference frequency range
  - System can be clocked from PLL or directly from crystal oscillator or relaxation oscillator
  - Low power modes supported
  - 2^n ($0 \le n \le 15$) low-power divider for extremely low frequency operation
- Interrupt controller
  - Uniquely programmable vectors for all interrupt sources
  - Fully programmable level and priority for all peripheral interrupt sources
  - Seven external interrupt signals with fixed level and priority
  - Unique vector number for each interrupt source
  - Ability to mask any individual interrupt source or all interrupt sources (global mask-all)
  - Support for hardware and software interrupt acknowledge (IACK) cycles
  - Combinatorial path to provide wake-up from low-power modes
- DMA controller
  - Four fully programmable channels
  - Dual-address transfer support with 8-, 16-, and 32-bit data capability, along with support for 16-byte (4×32-bit) burst transfers
  - Source/destination address pointers that can increment or remain constant
  - 24-bit byte transfer counter per channel
  - Auto-alignment transfers supported for efficient block movement
  - Bursting and cycle-steal support
  - Software-programmable DMA requests for the UARTs (3) and 32-bit timers (4)
  - Channel linking support
- Reset
  - Separate reset in and reset out signals
  - Seven sources of reset:
    - Power-on reset (POR)
    - External
    - Software
    - Watchdog
    - Loss of clock / loss of lock
    - Low-voltage detection (LVD)
    - JTAG
  - Status flag indication of source of last reset
- Chip configuration module (CCM)
  - System configuration during reset
  - Selects one of six clock modes
  - Configures output pad drive strength
  - Unique part identification number and part revision number
- General purpose I/O interface
  - Up to 56 bits of general purpose I/O
  - Bit manipulation supported via set/clear functions
  - Programmable drive strengths

— Unused peripheral pins may be used as extra GPIO
- JTAG support for system level board testing

1.2.2 V2 Core Overview

The version 2 ColdFire processor core is comprised of two separate pipelines decoupled by an instruction buffer. The two-stage instruction fetch pipeline (IFP) is responsible for instruction-address generation and instruction fetch. The instruction buffer is a first-in-first-out (FIFO) buffer that holds prefetched instructions awaiting execution in the operand execution pipeline (OEP). The OEP includes two pipeline stages. The first stage decodes instructions and selects operands (DSOC); the second stage (AGEX) performs instruction execution and calculates operand effective addresses, if needed.

The V2 core implements the ColdFire instruction set architecture revision A+ with support for a separate user stack pointer register and four new instructions to assist in bit processing. Additionally, the core includes the multiply-accumulate (MAC) unit for improved signal processing capabilities. The MAC implements a three-stage arithmetic pipeline, optimized for 16x16 bit operations, with support for one 32-bit accumulator. Supported operands include 16- and 32-bit signed and unsigned integers, signed fractional operands, and a complete set of instructions to process these data types. The MAC provides support for execution of DSP operations within the context of a single processor at a minimal hardware cost.

1.2.3 Integrated Debug Module

The ColdFire processor core debug interface is provided to support system debugging with low-cost debug and emulator development tools. Through a standard debug interface, access to debug information and real-time tracing capability is provided on 100-lead packages. This allows the processor and system to be debugged at full speed without the need for costly in-circuit emulators.

The on-chip breakpoint resources include a total of nine programmable 32-bit registers: an address and an address mask register, a data and a data mask register, four PC registers, and one PC mask register. These registers can be accessed through the dedicated debug serial communication channel or from the processor's supervisor mode programming model. The breakpoint registers can be configured to generate triggers by combining the address, data, and PC conditions in a variety of single- or dual-level definitions. The trigger event can be programmed to generate a processor halt or initiate a debug interrupt exception. This device implements revision B+ of the ColdFire Debug Architecture.

The processor's interrupt servicing options during emulator mode allow real-time critical interrupt service routines to be serviced while processing a debug interrupt event. This ensures the system continues to operate even during debugging.

To support program trace, the V2 debug module provides processor status (PST[3:0]) and debug data (DDATA[3:0]) ports. These buses and the PSTCLK output provide execution status, captured operand data, and branch target addresses defining processor activity at the CPU's clock rate. The device includes a new debug signal, ALLPST. This signal is the logical AND of the processor status (PST[3:0]) signals and is useful for detecting when the processor is in a halted state (PST[3:0] = 1111).

The full debug/trace interface is available only on the 100-pin packages. However, every product features the dedicated debug serial communication channel (DSI, DSO, DSCLK) and the ALLPST signal.

1.2.4 JTAG

The processor supports circuit board test strategies based on the Test Technology Committee of IEEE and the Joint Test Action Group (JTAG). The test logic includes a test access port (TAP) consisting of a 16-state controller, an instruction register, and three test registers (a 1-bit bypass register, a 256-bit boundary-scan register, and a 32-bit ID register). The boundary scan register links the device's pins into one shift register. Test logic, implemented using static logic design, is independent of the device system logic.

The device implementation can:

- Perform boundary-scan operations to test circuit board electrical continuity
- Sample system pins during operation and transparently shift out the result in the boundary scan register

1.2.9 QSPI

The queued serial peripheral interface (QSPI) provides a synchronous serial peripheral interface with queued transfer capability. It allows up to 16 transfers to be queued at once, minimizing the need for CPU intervention between transfers.

1.2.10 Fast ADC

The fast ADC consists of an eight-channel input select multiplexer and two independent sample and hold (S/H) circuits feeding separate 12-bit ADCs. The two separate converters store their results in accessible buffers for further processing.

The ADC can be configured to perform a single scan and halt, a scan when triggered, or a programmed scan sequence repeatedly until manually stopped.

The ADC can be configured for sequential or simultaneous conversion. When configured for sequential conversions, up to eight channels can be sampled and stored in any order specified by the channel list register. Both ADCs may be required during a scan, depending on the inputs to be sampled.

During a simultaneous conversion, both S/H circuits are used to capture two different channels at the same time. This configuration requires that a single channel may not be sampled by both S/H circuits simultaneously.

Optional interrupts can be generated at the end of the scan sequence if a channel is out of range (measures below the low threshold limit or above the high threshold limit set in the limit registers) or at several different zero crossing conditions.

1.2.11 DMA Timers (DTIM0–DTIM3)

There are four independent, DMA transfer capable 32-bit timers (DTIM0, DTIM1, DTIM2, and DTIM3) on the device. Each module incorporates a 32-bit timer with a separate register set for configuration and control. The timers can be configured to operate from the system clock or from an external clock source using one of the DTIN*n* signals. If the system clock is selected, it can be divided by 16 or 1. The input clock is further divided by a user-programmable 8-bit prescaler that clocks the actual timer counter register (TCR*n*). Each of these timers can be configured for input capture or reference (output) compare mode. Timer events may optionally cause interrupt requests or DMA transfers.

1.2.12 General Purpose Timer (GPT)

The general purpose timer (GPT) is a four-channel timer module consisting of a 16-bit programmable counter driven by a seven-stage programmable prescaler. Each of the four channels can be configured for input capture or output compare. Additionally, channel three, can be configured as a pulse accumulator.

A timer overflow function allows software to extend the timing capability of the system beyond the 16-bit range of the counter. The input capture and output compare functions allow simultaneous input waveform measurements and output waveform generation. The input capture function can capture the time of a selected transition edge. The output compare function can generate output waveforms and timer software delays. The 16-bit pulse accumulator can operate as a simple event counter or a gated time accumulator.

1.2.13 Periodic Interrupt Timers (PIT0 and PIT1)

The two periodic interrupt timers (PIT0 and PIT1) are 16-bit timers that provide interrupts at regular intervals with minimal processor intervention. Each timer can count down from the value written in its PIT modulus register or it can be a free-running down-counter.

1.2.21 Reset

The reset controller determines the source of reset, asserts the appropriate reset signals to the system, and keeps track of what caused the last reset. There are seven sources of reset:

- External reset input
- Power-on reset (POR)
- Watchdog timer
- Phase locked-loop (PLL) loss of lock / loss of clock
- Software
- Low-voltage detector (LVD)
- JTAG

Control of the LVD and its associated reset and interrupt are managed by the reset controller. Other registers provide status flags indicating the last source of reset and a control bit for software assertion of the $\overline{\text{RSTO}}$ pin.

1.2.22 GPIO

Nearly all pins on the device have general purpose I/O capability and are grouped into 8-bit ports. Some ports do not use all eight bits. Each port has registers that configure, monitor, and control the port pin.

1.2.23 Part Numbers and Packaging

This product is RoHS-compliant. Refer to the product page at freescale.com or contact your sales office for up-to-date RoHS information.

Table 2. Orderable Part Number Summary

Part Number	Flash / SRAM	Key Features	Package	Speed
MCF52100	64 Kbytes / 16 Kbytes	2 UARTs, 2 I^2C, QSPI, A/D, DMA, 16-/32-bit/PWM Timers	64 LQFP/QFN 81 MAPBGA	66, 80 MHz
MCF52110	128 Kbytes / 16 Kbytes	3 UARTs, 2 I^2C, QSPI, A/D, DMA, 16-/32-bit/PWM Timers	64 LQFP/QFN 81 MAPBGA 100 LQFP	66, 80 MHz

Figure 3 shows the pinout configuration for the 81 MAPBGA.

	1	2	3	4	5	6	7	8	9
A	V_{SS}	UTXD1	$\overline{RSTI}$	$\overline{IRQ5}$	$\overline{IRQ3}$	ALLPST	TDO	TMS	V_{SS}
B	$\overline{URTS1}$	URXD1	$\overline{RSTO}$	$\overline{IRQ6}$	$\overline{IRQ2}$	$\overline{TRST}$	TDI	V_{DD}PLL	EXTAL
C	$\overline{UCTS0}$	TEST	$\overline{UCTS1}$	$\overline{IRQ7}$	$\overline{IRQ4}$	$\overline{IRQ1}$	TCLK	V_{SS}PLL	XTAL

2 Electrical Characteristics

This section contains electrical specification tables and reference timing diagrams for the microcontroller unit, including detailed information on power considerations, DC/AC electrical characteristics, and AC timing specifications.

The electrical specifications are preliminary and are from previous designs or design simulations. These specifications may not be fully tested or guaranteed at this early stage of the product life cycle. These specifications will, however, be met for production silicon. Finalized specifications will be published after complete characterization and device qualifications have been completed.

NOTE

The parameters specified in this data sheet supersede any values found in the module specifications.

2.1 Maximum Ratings

Table 19. Absolute Maximum Ratings[1, 2]

Rating	Symbol	Value	Unit
Supply voltage	V_{DD}	–0.3 to +4.0	V
Clock synthesizer supply voltage	V_{DDPLL}	–0.3 to +4.0	V
RAM standby supply voltage	V_{STBY}	+1.8 to 3.5	V
Digital input voltage [3]	V_{IN}	–0.3 to +4.0	V
EXTAL pin voltage	V_{EXTAL}	0 to 3.3	V
XTAL pin voltage	V_{XTAL}	0 to 3.3	V
Instantaneous maximum current Single pin limit (applies to all pins)[4, 5]	I_{DD}	25	mA
Operating temperature range (packaged)	T_A (T_L - T_H)	–40 to 85[6]	°C
Storage temperature range	T_{stg}	–65 to 150	°C

1 Functional operating conditions are given in DC Electrical Specifications. Absolute Maximum Ratings are stress ratings only, and functional operation at the maxima is not guaranteed. Stress beyond those listed may affect device reliability or cause permanent damage to the device.

2 This device contains circuitry protecting against damage due to high static voltage or electrical fields; however, it is advised that normal precautions be taken to avoid application of any voltages higher than maximum-rated voltages to this high-impedance circuit. Reliability of operation is enhanced if unused inputs are tied to an appropriate logic voltage level (V_{SS} or V_{DD}).

3 Input must be current limited to the I_{DD} value specified. To determine the value of the required current-limiting resistor, calculate resistance values for positive and negative clamp voltages, then use the larger of the two values.

4 All functional non-supply pins are internally clamped to V_{SS} and V_{DD}.

5 The power supply must maintain regulation within operating V_{DD} range during instantaneous and operating maximum current conditions. If positive injection current ($V_{in} > V_{DD}$) is greater than I_{DD}, the injection current may flow out of V_{DD} and could result in the external power supply going out of regulation. Ensure that the external V_{DD} load shunts current greater than maximum injection current. This is the greatest risk when the MCU is not consuming power (e.g., no clock).

6 Depending on the packaging; see the orderable part number summary.

2.6 ESD Protection

Table 26. ESD Protection Characteristics[1, 2]

Characteristics	Symbol	Value	Units
ESD target for Human Body Model	HBM	2000	V
ESD target for Machine Model	MM	200	V
HBM circuit description	R_{series}	1500	Ω
	C	100	pF
MM circuit description	R_{series}	0	Ω
	C	200	pF
Number of pulses per pin (HBM) • Positive pulses • Negative pulses	 — —	 1 1	—
Number of pulses per pin (MM) • Positive pulses • Negative pulses	 — —	 3 3	—
Interval of pulses	—	1	sec

1 All ESD testing is in conformity with CDF-AEC-Q100 Stress Test Qualification for Automotive Grade Integrated Circuits.

2 A device is defined as a failure if after exposure to ESD pulses the device no longer meets the device specification requirements. Complete DC parametric and functional testing is performed per applicable device specification at room temperature followed by hot temperature, unless specified otherwise in the device specification.

2.7 DC Electrical Specifications

Table 27. DC Electrical Specifications [1]

Characteristic	Symbol	Min	Max	Unit
Supply voltage	V_{DD}	3.0	3.6	V
Standby voltage	V_{STBY}	1.8	3.5	V
Input high voltage	V_{IH}	$0.7 \times V_{DD}$	4.0	V
Input low voltage	V_{IL}	$V_{SS} - 0.3$	$0.35 \times V_{DD}$	V
Input hysteresis[2]	V_{HYS}	$0.06 \times V_{DD}$	—	mV
Low-voltage detect trip voltage (V_{DD} falling)	V_{LVD}	2.15	2.3	V
Low-voltage detect hysteresis (V_{DD} rising)	V_{LVDHYS}	60	120	mV
Input leakage current $V_{in} = V_{DD}$ or V_{SS}, digital pins	I_{in}	–1.0	1.0	μA
Output high voltage (all input/output and all output pins) $I_{OH} = -2.0$ mA	V_{OH}	$V_{DD} - 0.5$	—	V
Output low voltage (all input/output and all output pins) $I_{OL} = 2.0$mA	V_{OL}	—	0.5	V

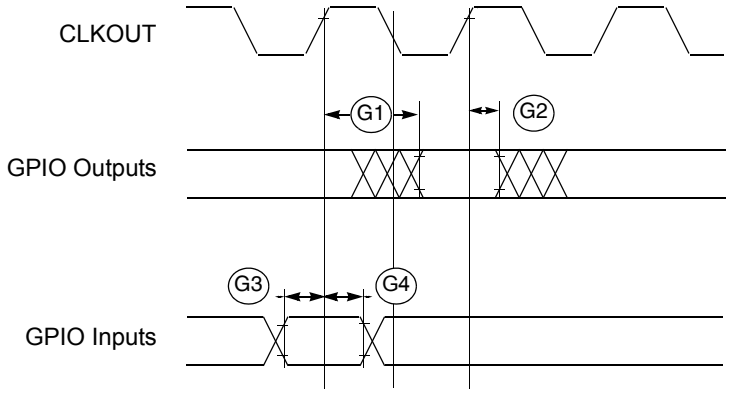

Figure 5. GPIO Timing

2.10 Reset Timing

Table 30. Reset and Configuration Override Timing

(V_{DD} = 3.0 to 3.6 V, V_{SS} = 0 V, T_A = T_L to T_H)[1]

NUM	Characteristic	Symbol	Min	Max	Unit
R1	$\overline{\text{RSTI}}$ input valid to CLKOUT High	t_{RVCH}	9	—	ns
R2	CLKOUT High to $\overline{\text{RSTI}}$ Input invalid	t_{CHRI}	1.5	—	ns
R3	$\overline{\text{RSTI}}$ input valid time [2]	t_{RIVT}	5	—	t_{CYC}
R4	CLKOUT High to $\overline{\text{RSTO}}$ Valid	t_{CHROV}	—	10	ns

1 All AC timing is shown with respect to 50% V_{DD} levels unless otherwise noted.

2 During low power STOP, the synchronizers for the $\overline{\text{RSTI}}$ input are bypassed and $\overline{\text{RSTI}}$ is asserted asynchronously to the system. Thus, $\overline{\text{RSTI}}$ must be held a minimum of 100 ns.

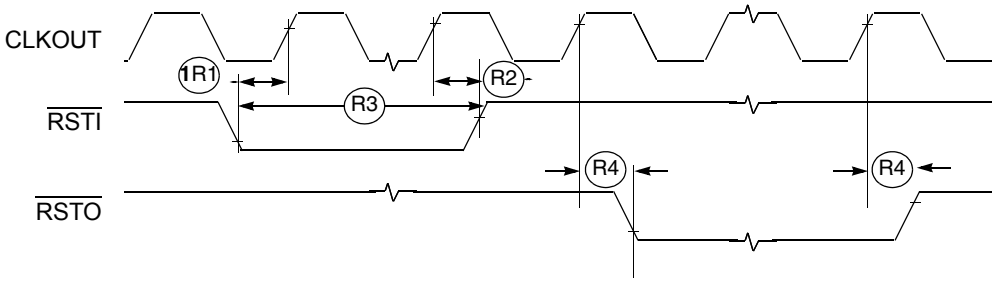

Figure 6. $\overline{\text{RSTI}}$ and Configuration Override Timing

2.11 I²C Input/Output Timing Specifications

Table 31 lists specifications for the I²C input timing parameters shown in Figure 7.

Table 31. I^2C Input Timing Specifications between I2C_SCL and I2C_SDA

Num	Characteristic	Min	Max	Units
11	Start condition hold time	$2 \times t_{CYC}$	—	ns
I2	Clock low period	$8 \times t_{CYC}$	—	ns
I3	SCL/SDA rise time (V_{IL} = 0.5 V to V_{IH} = 2.4 V)	—	1	ms
I4	Data hold time	0	—	ns
I5	SCL/SDA fall time (V_{IH} = 2.4 V to V_{IL} = 0.5 V)	—	1	ms
I6	Clock high time	$4 \times t_{CYC}$	—	ns
I7	Data setup time	0	—	ns
I8	Start condition setup time (for repeated start condition only)	$2 \times t_{CYC}$	—	ns
I9	Stop condition setup time	$2 \times t_{CYC}$	—	ns

Table 32 lists specifications for the I^2C output timing parameters shown in Figure 7.

Table 32. I^2C Output Timing Specifications between I2C_SCL and I2C_SDA

Num	Characteristic	Min	Max	Units
11[1]	Start condition hold time	$6 \times t_{CYC}$	—	ns
I2[1]	Clock low period	$10 \times t_{CYC}$	—	ns
I3[2]	I2C_SCL/I2C_SDA rise time (V_{IL} = 0.5 V to V_{IH} = 2.4 V)	—	—	µs
I4[1]	Data hold time	$7 \times t_{CYC}$	—	ns
I5[3]	I2C_SCL/I2C_SDA fall time (V_{IH} = 2.4 V to V_{IL} = 0.5 V)	—	3	ns
I6[1]	Clock high time	$10 \times t_{CYC}$	—	ns
I7[1]	Data setup time	$2 \times t_{CYC}$	—	ns
I8[1]	Start condition setup time (for repeated start condition only)	$20 \times t_{CYC}$	—	ns
I9[1]	Stop condition setup time	$10 \times t_{CYC}$	—	ns

1 Output numbers depend on the value programmed into the IFDR; an IFDR programmed with the maximum frequency (IFDR = 0x20) results in minimum output timings as shown in Table 32. The I^2C interface is designed to scale the actual data transition time to move it to the middle of the SCL low period. The actual position is affected by the prescale and division values programmed into the IFDR; however, the numbers given in Table 32 are minimum values.

2 Because SCL and SDA are open-collector-type outputs, which the processor can only actively drive low, the time SCL or SDA take to reach a high level depends on external signal capacitance and pull-up resistor values.

3 Specified at a nominal 50-pF load.

Figure 7 shows timing for the values in Table 31 and Table 32.

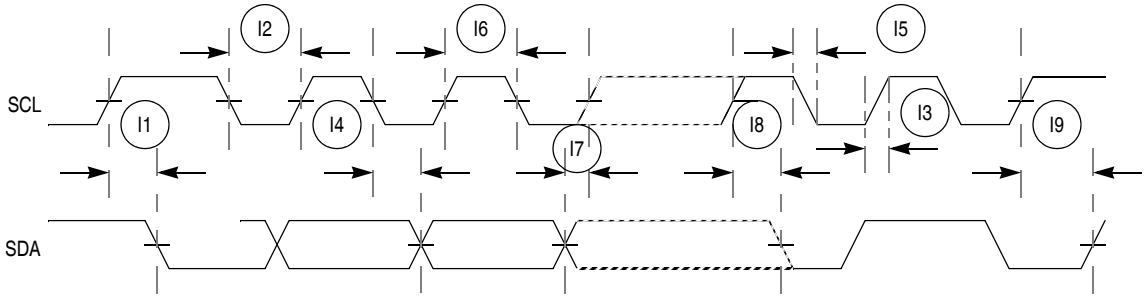

Figure 7. I²C Input/Output Timings

2.12 Analog-to-Digital Converter (ADC) Parameters

Table 33 lists specifications for the analog-to-digital converter.

Table 33. ADC Parameters[1]

Name	Characteristic	Min	Typical	Max	Unit
V_{REFL}	Low reference voltage	V_{SSA}	—	V_{SSA}	V
V_{REFH}	High reference voltage	V_{DDA}	—	V_{DDA}	V
V_{DDA}	ADC analog supply voltage	3.0	3.3	3.6	V
V_{ADIN}	Input voltages	V_{REFL}	—	V_{REFH}	V
RES	Resolution	12	—	12	Bits
INL	Integral non-linearity (full input signal range)[2]	—	±2.5	±3	LSB[3]
INL	Integral non-linearity (10% to 90% input signal range)[4]	—	±2.5	±3	LSB
DNL	Differential non-linearity	—	–1 < DNL < +1	<+1	LSB
Monotonicity		GUARANTEED			
f_{ADIC}	ADC internal clock	0.1	—	5.0	MHz
R_{AD}	Conversion range	V_{REFL}	—	V_{REFH}	V
t_{ADPU}	ADC power-up time[5]	—	6	13	t_{AIC} cycles[6]
t_{REC}	Recovery from auto standby	—	0	1	t_{AIC} cycles
t_{ADC}	Conversion time	—	6	—	t_{AIC} cycles
t_{ADS}	Sample time	—	1	—	t_{AIC} cycles
C_{ADI}	Input capacitance	—	See Figure 8	—	pF
X_{IN}	Input impedance	—	See Figure 8	—	W
I_{ADI}	Input injection current[7], per pin	—	—	3	mA
I_{VREFH}	V_{REFH} current	—	0	—	mA
V_{OFFSET}	Offset voltage internal reference	—	±8	±15	mV
E_{GAIN}	Gain error (transfer path)	.99	1	1.01	—
V_{OFFSET}	Offset voltage external reference	—	±3	9	mV
SNR	Signal-to-noise ratio	—	62 to 66	—	dB

NOTES:

1. DIMENSIONS ARE IN MILLIMETERS.
2. DIMENSIONING AND TOLERANCING PER ASME Y14.5M-1994.
3. DATUMS A, B AND D TO BE DETERMINED AT DATUM PLANE H.
4. DIMENSIONS TO BE DETERMINED AT SEATING PLANE C.
5. THIS DIMENSION DOES NOT INCLUDE DAMBAR PROTRUSION. ALLOWABLE DAMBAR PROTRUSION SHALL NOT CAUSE THE LEAD WIDTH TO EXCEED THE UPPER LIMIT BY MORE THAN 0.08 mm AT MAXIMUM MATERIAL CONDITION. DAMBAR CANNOT BE LOCATED ON THE LOWER RADIUS OR THE FOOT. MINIMUM SPACE BETWEEN PROTRUSION AND ADJACENT LEAD SHALL NOT BE LESS THAN 0.07 mm.
6. THIS DIMENSION DOES NOT INCLUDE MOLD PROTRUSION. ALLOWABLE PROTRUSION IS 0.25 mm PER SIDE. THIS DIMENSION IS MAXIMUM PLASTIC BODY SIZE DIMENSION INCLUDING MOLD MISMATCH.
7. EXACT SHAPE OF EACH CORNER IS OPTIONAL.
8. THESE DIMENSIONS APPLY TO THE FLAT SECTION OF THE LEAD BETWEEN 0.1 mm AND 0.25 mm FROM THE LEAD TIP.

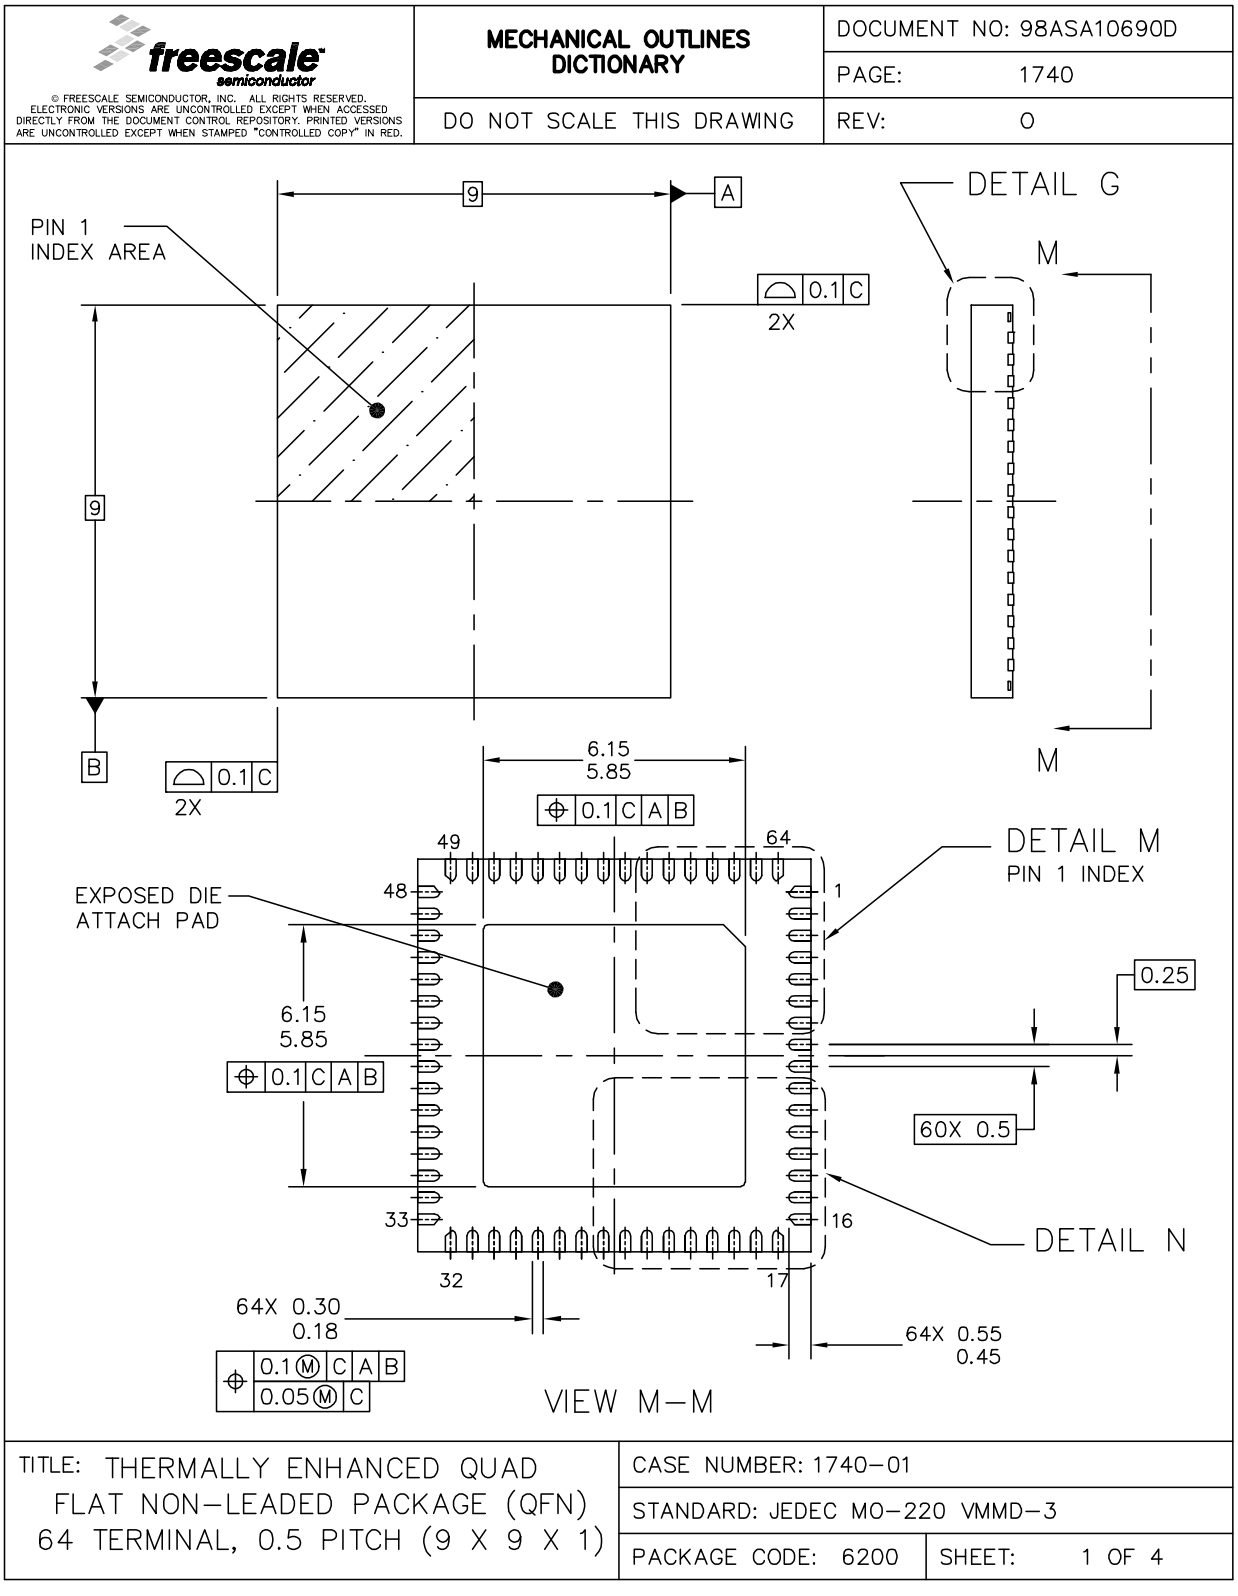
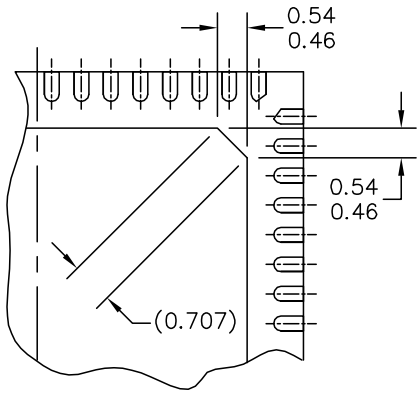
TITLE: 64LD LQFP, 10 X 10 X 1.4 PKG, 0.5 PITCH, CASE OUTLINE	DOCUMENT NO: 98ASS23234W	REV: D
	CASE NUMBER: 840F-02	06 APR 2005
	STANDARD: JEDEC MS-026 BCD	

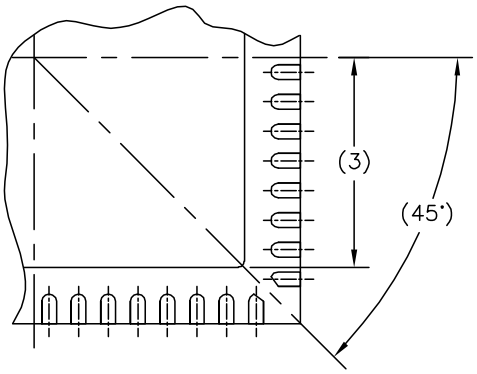
3.2 64 QFN Package



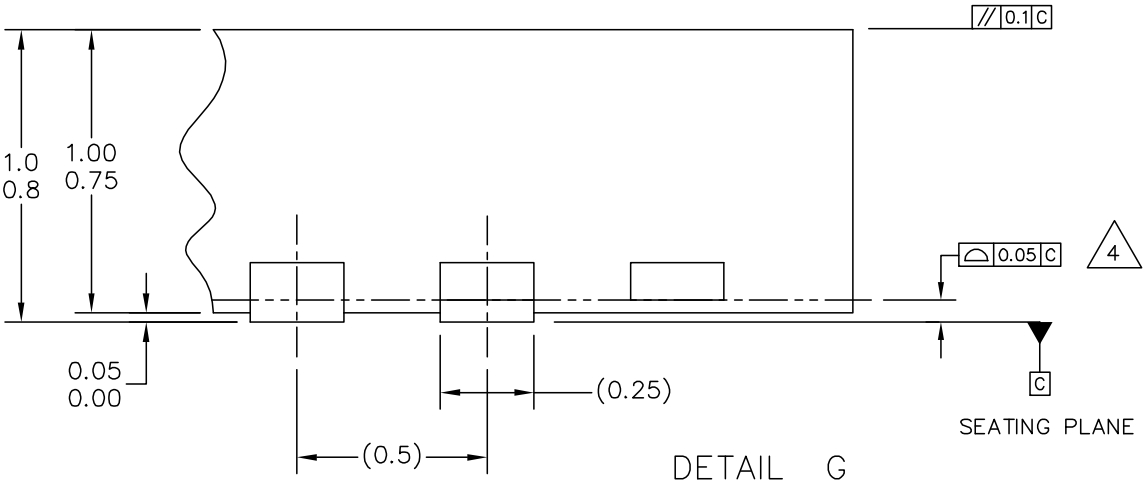
freescale semiconductor	MECHANICAL OUTLINES DICTIONARY	DOCUMENT NO: 98ASA10690D
		PAGE: 1740
	DO NOT SCALE THIS DRAWING	REV: O



DETAIL M
PREFERRED PIN1 BACKSIDE IDENTIFIER



DETAIL N
PREFERRED CORNER CONFIGURATION



DETAIL G
VIEW ROTATED 90° CW

TITLE: THERMALLY ENHANCED QUAD FLAT NON-LEADED PACKAGE (QFN) 64 TERMINAL, 0.5 PITCH (9 X 9 X 1)	CASE NUMBER: 1740-01	
	STANDARD: JEDEC MO-220 VMMD-3	
	PACKAGE CODE: 6200	SHEET: 2 OF 4

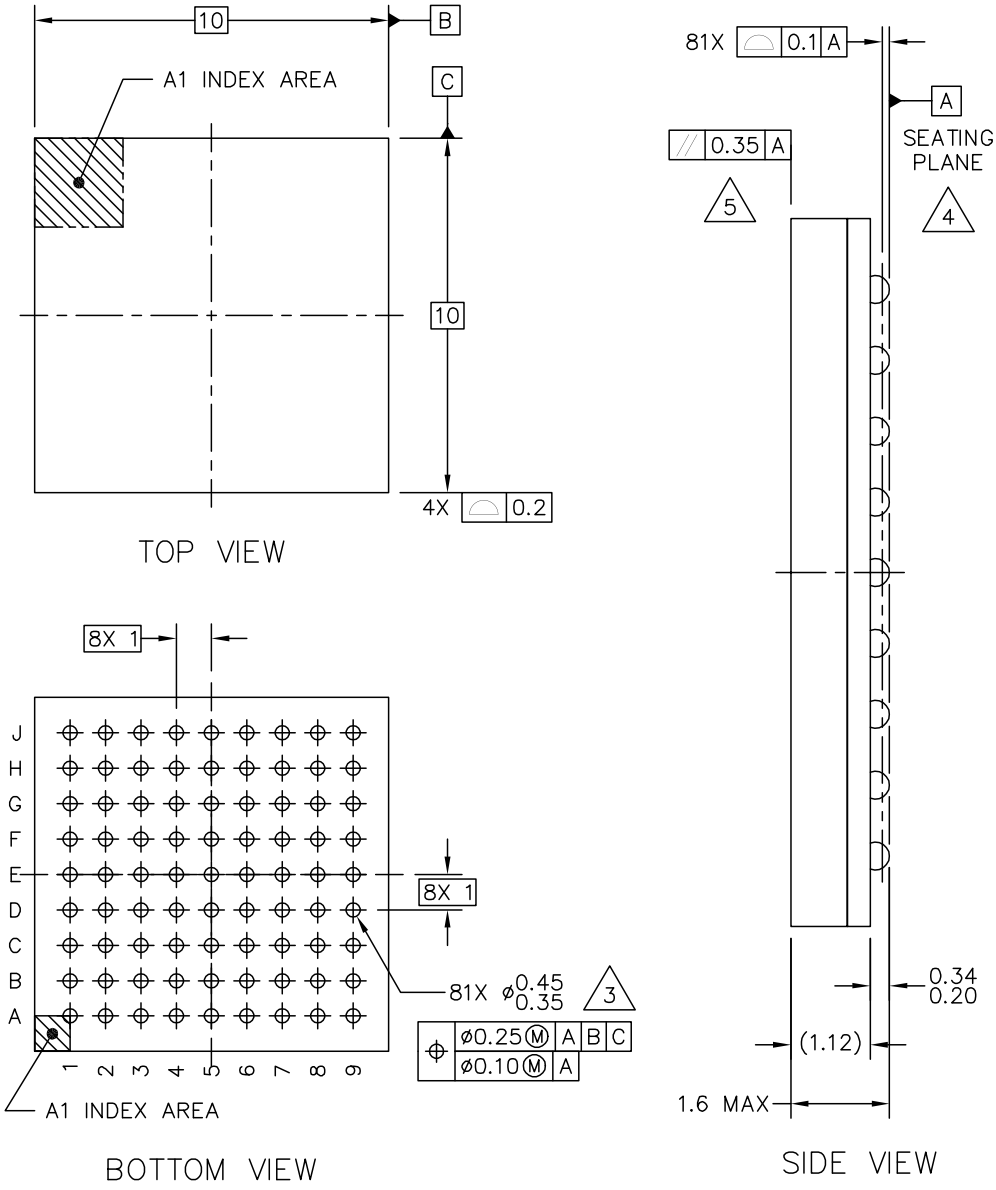
freescale semiconductor	MECHANICAL OUTLINES DICTIONARY	DOCUMENT NO: 98ASA10690D
		PAGE: 1740
	DO NOT SCALE THIS DRAWING	REV: O

NOTES:

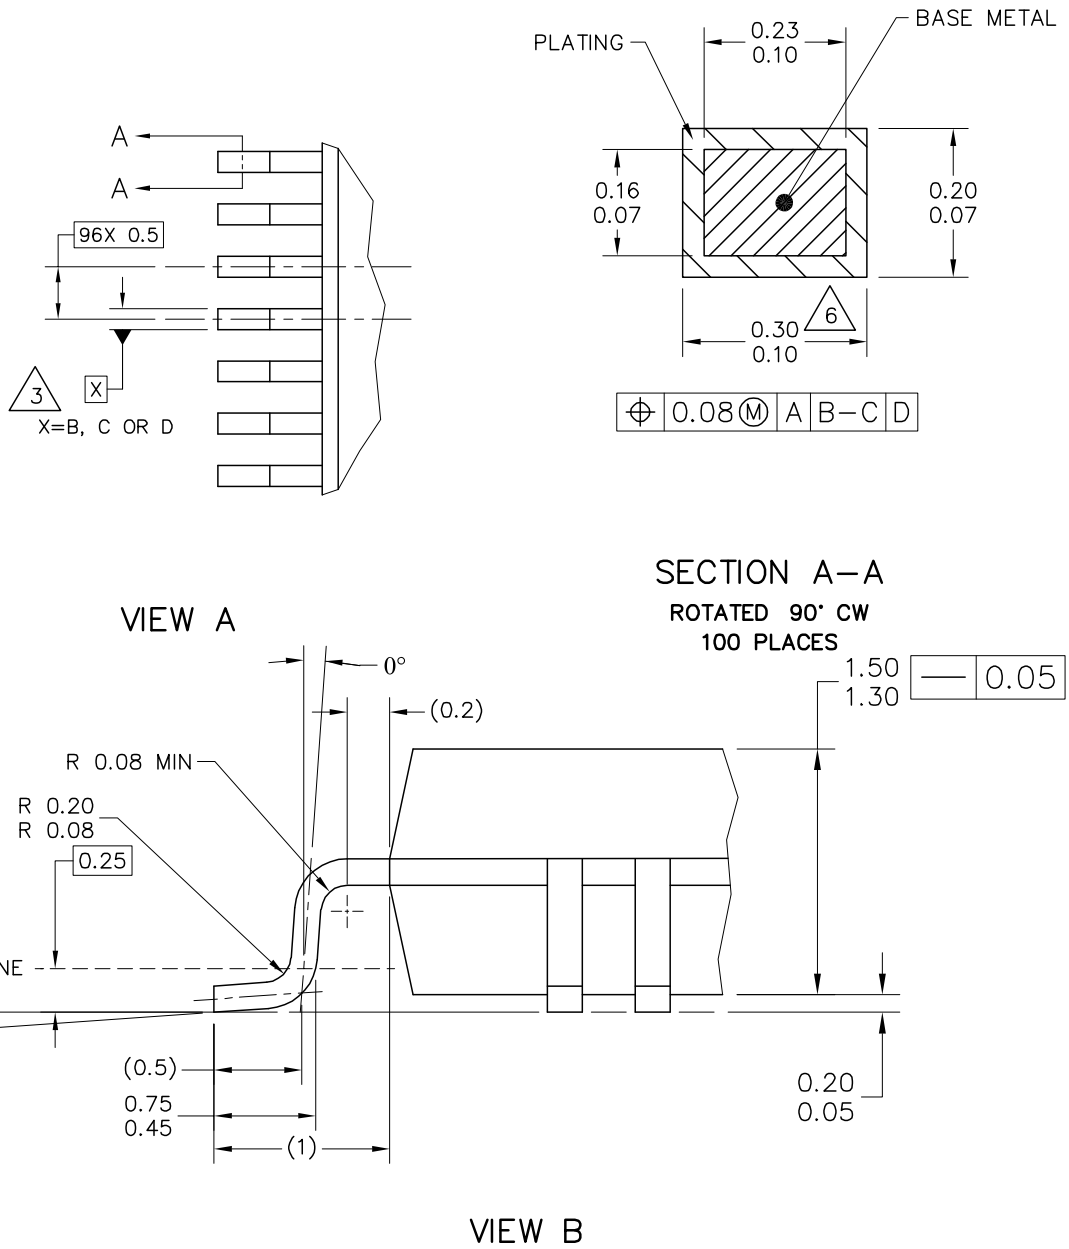
1. ALL DIMENSIONS ARE IN MILLIMETERS.
2. INTERPRET DIMENSIONS AND TOLERANCES PER ASME Y14.5M–1994.
3. THE COMPLETE JEDEC DESIGNATOR FOR THIS PACKAGE IS: HF–PQFN.
4. COPLANARITY APPLIES TO LEADS, CORNER LEADS AND DIE ATTACH PAD.
5. MIN METAL GAP SHOULD BE 0.2MM.

TITLE: THERMALLY ENHANCED QUAD FLAT NON–LEADED PACKAGE (QFN) 64 TERMINAL, 0.5 PITCH (9 X 9 X 1)	CASE NUMBER: 1740–01	
	STANDARD: JEDEC MO–220 VMMD–3	
	PACKAGE CODE: 6200	SHEET: 3 OF 4

3.3 81 MAPBGA Package



© FREESCALE SEMICONDUCTOR, INC. ALL RIGHTS RESERVED.	MECHANICAL OUTLINE	PRINT VERSION NOT TO SCALE
TITLE: PBGA, LOW PROFILE, 81 I/O, 10 X 10 PKG, 1 MM PITCH (MAP)	DOCUMENT NO: 98ASA10670D	REV: O
	CASE NUMBER: 1662–01	04 FEB 2005
	STANDARD: NON–JEDEC	



© FREESCALE SEMICONDUCTOR, INC. ALL RIGHTS RESERVED.	**MECHANICAL OUTLINE**	PRINT VERSION NOT TO SCALE
TITLE: 100 LEAD LQFP 14 X 14, 0.5 PITCH, 1.4 THICK	DOCUMENT NO: 98ASS23308W	REV: G
	CASE NUMBER: 983–03	07 APR 2005
	STANDARD: NON–JEDEC	

4 Revision History

Table 38. Revision History

Revision	Description
0	Initial public release.
1	• Updated Clock generation features • Changed crystal frequency range maximum to 25 MHz • Updated Table: Clocking Modes and added appropriate footnote • In Table: CLock Source Electrical Specifications, updated the following values: fcrystal, fext, fref_pll, EXTAL input high voltage (External reference)
