#### What is "[Embedded - Microcontrollers](#)"?

"[Embedded - Microcontrollers](#)" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

##### Details

Product Status	Active
Core Processor	ARM® Cortex®-M0
Core Size	32-Bit Single-Core
Speed	50MHz
Connectivity	EBI/EMI, I²C, IrDA, SmartCard, SPI, UART/USART
Peripherals	Brown-out Detect/Reset, DMA, I²S, LVD, POR, PS2, PWM, WDT
Number of I/O	51
Program Memory Size	64KB (64K x 8)
Program Memory Type	FLASH
EEPROM Size	4K x 8
RAM Size	8K x 8
Voltage - Supply (Vcc/Vdd)	2.5V ~ 5.5V
Data Converters	A/D 8x12b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 85°C (TA)
Mounting Type	Surface Mount
Package / Case	64-LQFP
Supplier Device Package	64-LQFP (10x10)

- Supports three wire, no slave select signal, bi-direction interface
- I<sup>2</sup>C
  - Up to two sets of I<sup>2</sup>C device
  - Master/Slave mode
  - Bidirectional data transfer between masters and slaves
  - Multi-master bus (no central master)
  - Arbitration between simultaneously transmitting masters without corruption of serial data on the bus
  - Serial clock synchronization allowing devices with different bit rates to communicate via one serial bus
  - Serial clock synchronization used as a handshake mechanism to suspend and resume serial transfer
  - Programmable clocks allowing for versatile rate control
  - Supports multiple address recognition (four slave address with mask option)
  - Supports wake-up function
- I<sup>2</sup>S
  - Interface with external audio CODEC
  - Operate as either Master or Slave mode
  - Capable of handling 8-, 16-, 24- and 32-bit word sizes
  - Supports mono and stereo audio data
  - Supports I<sup>2</sup>S and MSB justified data format
  - Provides two 8 word FIFO data buffers, one for transmitting and the other for receiving
  - Generates interrupt requests when buffer levels cross a programmable boundary
  - Supports two DMA requests, one for transmitting and the other for receiving
- PS/2 Device
  - Host communication inhibit and request to send detection
  - Reception frame error detection
  - Programmable 1 to 16 bytes transmit buffer to reduce CPU intervention
  - Double buffer for data reception
  - Software override bus
- EBI (External bus interface)
  - Accessible space: 64 KB in 8-bit mode or 128 KB in 16-bit mode
  - Supports 8-/16-bit data width
  - Supports byte write in 16-bit data width mode
- ADC
  - 12-bit SAR ADC with 760 kSPS
  - Up to 8-ch single-end input or 4-ch differential input
  - Single scan/single cycle scan/continuous scan
  - Each channel with individual result register
  - Scan on enabled channels
  - Threshold voltage detection
  - Conversion started by software programming or external input
  - Supports PDMA mode
- Analog Comparator
  - Up to two analog comparators
  - External input or internal Band-gap voltage selectable at negative node
  - Interrupt when compare results change
  - Supports Power-down wake-up
- Smart Card Host (SC)
  - Compliant to ISO-7816-3 T=0, T=1
  - Supports up to three ISO-7816-3 ports

### 6.2.2.1 nRESET Reset

The nRESET reset means to generate a reset signal by pulling low nRESET pin, which is an asynchronous reset input pin and can be used to reset system at any time. When the nRESET voltage is lower than  $0.2 V_{DD}$  and the state keeps longer than 36 us (glitch filter), chip will be reset. The nRESET reset will control the chip in reset state until the nRESET voltage rises above  $0.7 V_{DD}$  and the state keeps longer than 36 us (glitch filter). The RSTS\_RESET (RSTSRC[1]) will be set to 1 if the previous reset source is nRESET reset. Figure 6-3 shows the nRESET reset waveform.

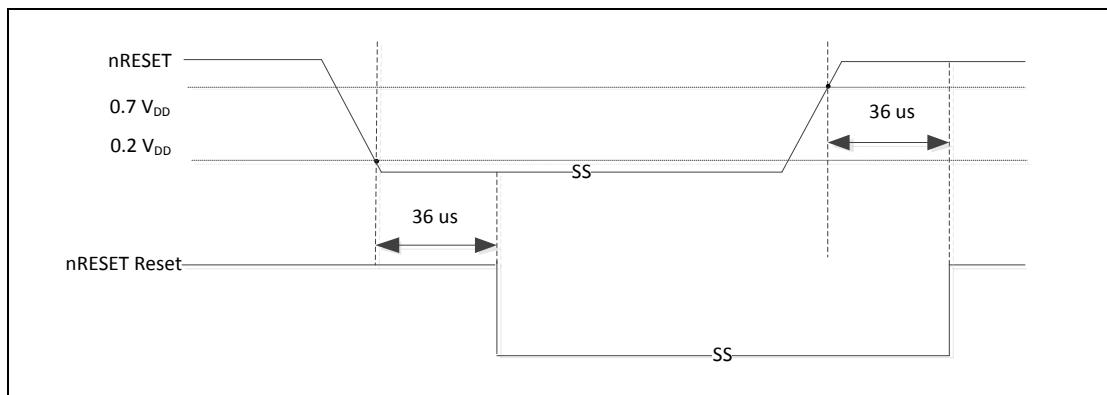

Figure 6-3 nRESET Reset Waveform

### 6.2.2.2 Power-On Reset (POR)

The Power-on reset (POR) is used to generate a stable system reset signal and forces the system to be reset when power-on to avoid unexpected behavior of MCU. When applying the power to MCU, the POR module will detect the rising voltage and generate reset signal to system until the voltage is ready for MCU operation. At POR reset, the RSTS\_POR (RSTSRC[0]) will be set to 1 to indicate there is a POR reset event. The RSTS\_POR (RSTSRC[0]) bit can be cleared by writing 1 to it. Figure 6-4 shows the waveform of Power-On reset.

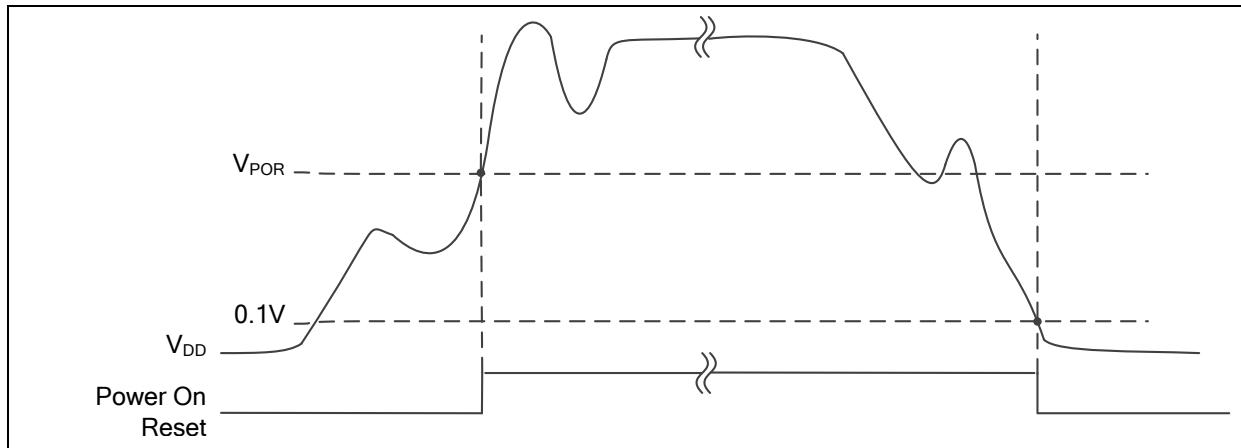

Figure 6-4 Power-on Reset (POR) Waveform

### 6.2.2.3 Low Voltage Reset (LVR)

If the Low Voltage Reset function is enabled by setting the Low Voltage Reset Enable Bit LVR\_EN (BODCR[7]) to 1, after 100us delay, LVR detection circuit will be stable and the LVR function will be active. Then LVR function will detect  $AV_{DD}$  during system operation. When the

### 6.2.3 Power Modes and Wake-up Sources

There are several wake-up sources in Idle mode and Power-down mode. Table 6-2 lists the available clocks for each power mode.

Power Mode	Normal Mode	Idle Mode	Power-down Mode
<b>Definition</b>	CPU is in active state	CPU is in sleep state	CPU is in sleep state and all clocks stop except LXT and LIRC. SRAM content retended.
<b>Entry Condition</b>	Chip is in normal mode after system reset released	CPU executes WFI instruction.	CPU sets sleep mode enable and power down enable and executes WFI instruction.
<b>Wake-up Sources</b>	N/A	All interrupts	RTC, WDT, I <sup>2</sup> C, Timer, UART, BOD, USB and GPIO
<b>Available Clocks</b>	All	All except CPU clock	LXT and LIRC
<b>After Wake-up</b>	N/A	CPU back to normal mode	CPU back to normal mode

Table 6-2 Power Mode Difference Table

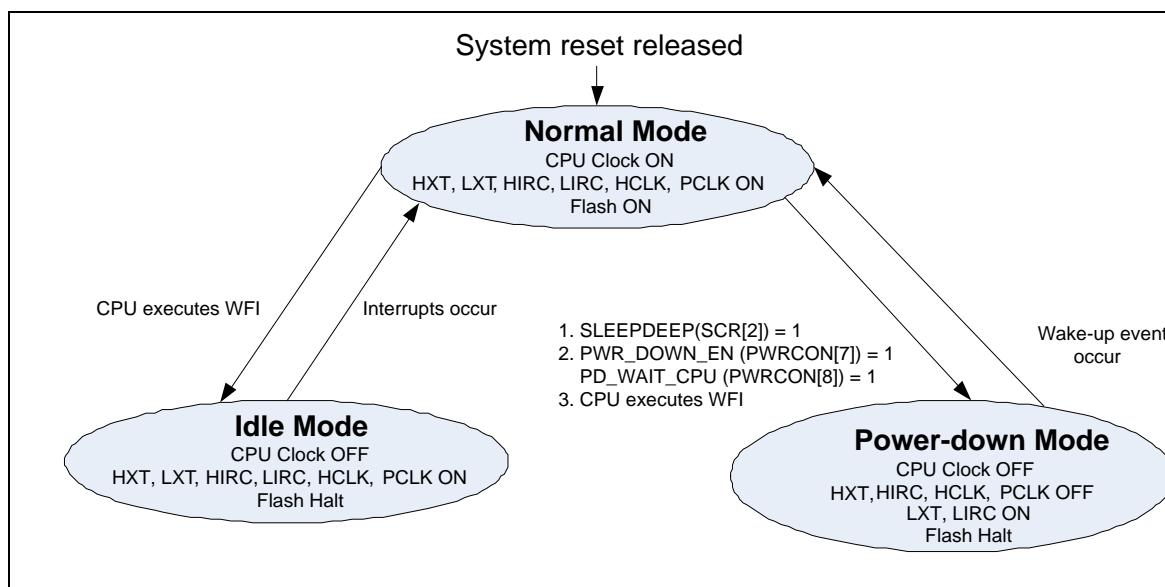

Figure 6-7 Power Mode State Machine

1. LXT (32 kHz XTL) ON or OFF depends on S/W setting in run mode.
2. LIRC (10 kHz OSC) ON or OFF depends on S/W setting in run mode.

### 6.3.4 Peripherals Clock

The peripherals clock can be selected as different clock source depends on the clock source select control registers (CLKSEL1, CLKSEL2 and CLKSEL3).

### 6.3.5 Power-down Mode Clock

When chip enters Power-down mode, system clocks, some clock sources, and some peripheral clocks will be disabled. Some clock sources and peripherals clocks are still active in Power-down mode.

The clocks still kept active are listed below:

- Clock Generator
  - ◆ Internal 10 kHz low speed oscillator clock
  - ◆ External 32.768 kHz low speed crystal clock
- Peripherals Clock (when IP adopt external 32.768 kHz low speed crystal oscillator or 10 kHz low speed oscillator as clock source)

### 6.3.6 Frequency Divider Output

This device is equipped with a power-of-2 frequency divider which is composed by 16 chained divide-by-2 shift registers. One of the 16 shift register outputs selected by a sixteen to one multiplexer is reflected to CLKO function pin. Therefore there are 16 options of power-of-2 divided clocks with the frequency from  $F_{in}/2^1$  to  $F_{in}/2^{16}$  where  $F_{in}$  is input clock frequency to the clock divider.

The output formula is  $F_{out} = F_{in}/2^{(N+1)}$ , where  $F_{in}$  is the input clock frequency,  $F_{out}$  is the clock divider output frequency and N is the 4-bit value in FSEL (FRQDIV[3:0]).

When writing 1 to DIVIDER\_EN (FRQDIV[4]), the chained counter starts to count. When writing 0 to DIVIDER\_EN (FRQDIV[4]), the chained counter continuously runs till divided clock reaches low state and stay in low state.

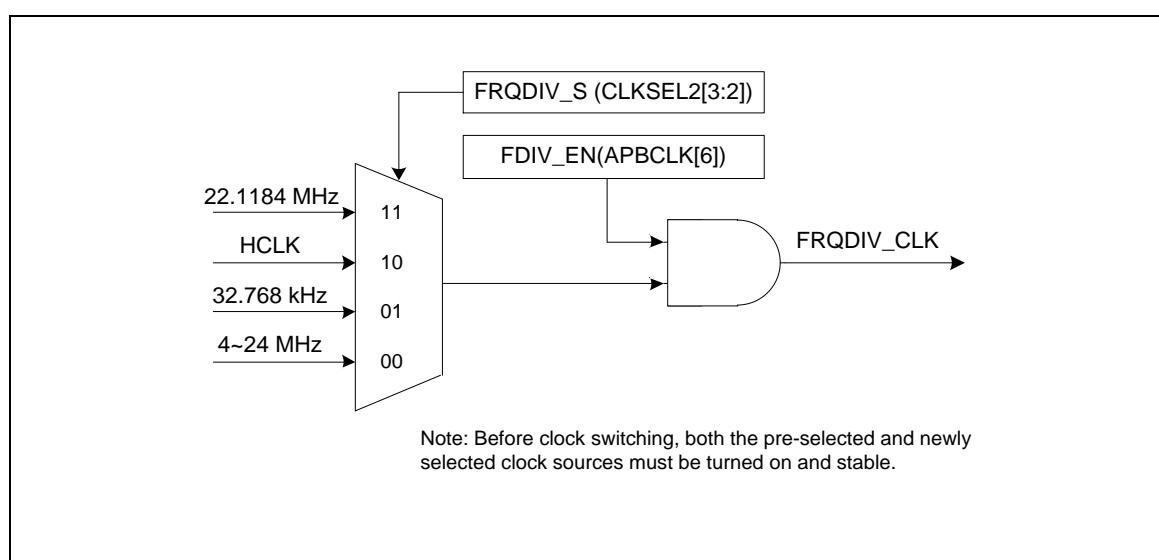

Figure 6-14 Clock Source of Frequency Divider

## 6.8 Timer Controller (TMR)

### 6.8.1 Overview

The timer controller includes four 32-bit timers, TIMER0~TIMER3, allowing user to easily implement a timer control for applications. The timer can perform functions, such as frequency measurement, event counting, interval measurement, clock generation, and delay timing. The timer can generate an interrupt signal upon time-out, or provide the current value during operation.

### 6.8.2 Features

- Four sets of 32-bit timers with 24-bit up counter and one 8-bit prescale counter
- Independent clock source for each timer
- Provides one-shot, periodic, toggle and continuous counting operation modes
- Time-out period = (Period of timer clock input) \* (8-bit prescale counter + 1) \* (24-bit TCMP)
- Maximum counting cycle time =  $(1 / T \text{ MHz}) * (2^8) * (2^{24})$ , T is the period of timer clock
- 24-bit up counter value is readable through TDR (Timer Data Register)
- Supports event counting function to count the event from external pin
- Supports external pin capture function for interval measurement
- Supports external pin capture function for reset timer counter
- Supports chip wake-up from Idle/Power-down mode if a timer interrupt signal is generated (TIF set to 1)

SIR Protocol encoder/decoder. The IrDA SIR Protocol encoder/decoder is half-duplex only. So it cannot transmit and receive data at the same time. The IrDA SIR physical layer specifies a minimum 10ms transfer delay between transmission and reception, and this delay feature must be implemented by software.

The alternate function of UART controllers is LIN (Local Interconnect Network) function. The LIN mode is selected by setting the UA\_FUN\_SEL[1:0] to '01'. In LIN mode, 1 start bit and 8 data bits format with 1 stop bit are required in accordance with the LIN standard.

For NuMicro® NUC100 series, another alternate function of UART controllers is RS-485 9-bit mode, and direction control provided by /RTS pin or can program GPIO (PB.2 for UART0\_nRTS and PB.6 for UART1\_nRTS) to implement the function by software. The RS-485 mode is selected by setting the UA\_FUN\_SEL register to select RS-485 function. The RS-485 transceiver control is implemented using the /RTS control signal from an asynchronous serial port to enable the RS-485 transceiver. In RS-485 mode, many characteristics of the receiving and transmitting are same as UART.

#### 6.14.2 Features

- Full duplex, asynchronous communications
- Separates receive / transmit 64/16/16 bytes (UART0/UART1/UART2) entry FIFO for data payloads
- Supports hardware auto flow control/flow control function (CTS, RTS) and programmable RTS flow control trigger level (UART0 and UART1 support)
- Programmable receiver buffer trigger level
- Supports programmable baud-rate generator for each channel individually
- Supports CTS wake-up function (UART0 and UART1 support)
- Supports 7-bit receiver buffer time-out detection function
- UART0/UART1 can through DMA channels to receive/transmit data
- Programmable transmitting data delay time between the last stop and the next start bit by setting UA\_TOR [DLY] register
- Supports break error, frame error, parity error and receive / transmit buffer overflow detect function
- Fully programmable serial-interface characteristics
  - Programmable data bit length, 5-, 6-, 7-, 8-bit character
  - Programmable parity bit, even, odd, no parity or stick parity bit generation and detection
  - Programmable stop bit length, 1, 1.5, or 2 stop bit generation
- IrDA SIR function mode
  - Supports 3-/16-bit duration for normal mode
- LIN function mode
  - Supports LIN master/slave mode
  - Supports programmable break generation function for transmitter
  - Supports break detect function for receiver
- RS-485 function mode.

## 6.21 Analog-to-Digital Converter (ADC)

### 6.21.1 Overview

The NuMicro® NUC100 series contains one 12-bit successive approximation analog-to-digital converters (SAR A/D converter) with 8 input channels. The A/D converter supports three operation modes: single, single-cycle scan and continuous scan mode. The A/D converter can be started by software, PWM Center-aligned trigger and external STADC pin.

### 6.21.2 Features

- Analog input voltage range:  $0 \sim V_{REF}$
- 12-bit resolution and 10-bit accuracy is guaranteed
- Up to 8 single-end analog input channels or 4 differential analog input channels
- Up to 760 kSPS conversion rate as ADC clock frequency is 16 MHz (chip working at 5V)
- Three operating modes
  - Single mode: A/D conversion is performed one time on a specified channel
  - Single-cycle scan mode: A/D conversion is performed one cycle on all specified channels with the sequence from the smallest numbered channel to the largest numbered channel
  - Continuous scan mode: A/D converter continuously performs Single-cycle scan mode until software stops A/D conversion
- An A/D conversion can be started by:
  - Writing 1 to ADST bit through software
  - PWM Center-aligned trigger
  - External pin STADC
- Conversion results are held in data registers for each channel with valid and overrun indicators
- Conversion result can be compared with specify value and user can select whether to generate an interrupt when conversion result matches the compare register setting
- Channel 7 supports 3 input sources: external analog voltage, internal Band-gap voltage, and internal temperature sensor output

#### 8.4.5 Power-on Reset Specification

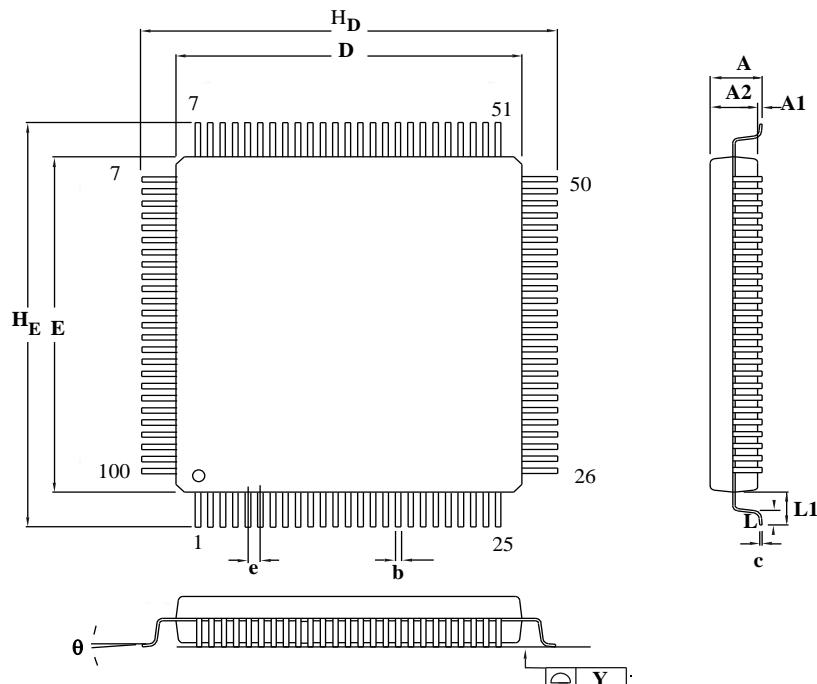

PARAMETER	CONDITION	MIN.	TYP.	MAX.	UNIT
Operation Temperature	-	-40	25	85	°C
Reset Voltage	$V_+$	-	2	-	V
Quiescent Current	$V_{in} > \text{reset voltage}$	-	1	-	nA

## 8.4.8.4 USB LDO Specification

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
$V_{BUS}$	VBUS Pin Input Voltage		4.0	5.0	5.5	V
$V_{DD33}$	LDO Output Voltage		3.0	3.3	3.6	V
$C_{bp}$	External Bypass Capacitor			1.0	-	uF

## 9 PACKAGE DIMENSIONS

### 9.1 100-pin LQFP (14x14x1.4 mm footprint 2.0 mm)
