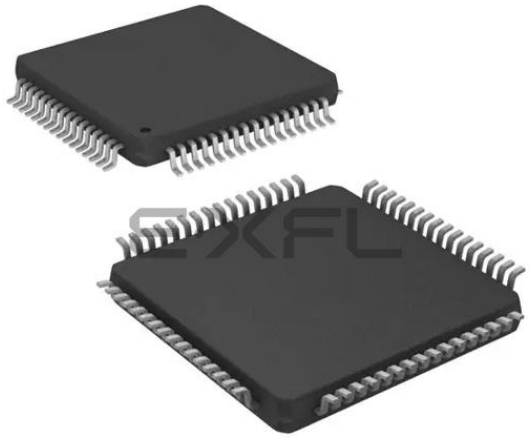
Microchip Technology - PIC32MK1024GPE064T-I/PT Datasheet



Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Active
Core Processor	MIPS32® microAptiv™
Core Size	32-Bit Single-Core
Speed	120MHz
Connectivity	CANbus, IrDA, LINbus, PMP, SPI, UART/USART, USB OTG
Peripherals	Brown-out Detect/Reset, DMA, I²S, POR, WDT
Number of I/O	48
Program Memory Size	1MB (1M x 8)
Program Memory Type	FLASH
EEPROM Size	4K x 8
RAM Size	256K x 8
Voltage - Supply (Vcc/Vdd)	2.2V ~ 3.6V
Data Converters	A/D 26x12b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 85°C (TA)
Mounting Type	Surface Mount
Package / Case	64-TQFP
Supplier Device Package	64-TQFP (10x10)
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/pic32mk1024gpe064t-i-pt

NOTES:

2.8 Unused I/Os

Unused I/O pins should not be allowed to float as inputs. They can be configured as outputs and driven to a logic-low state.

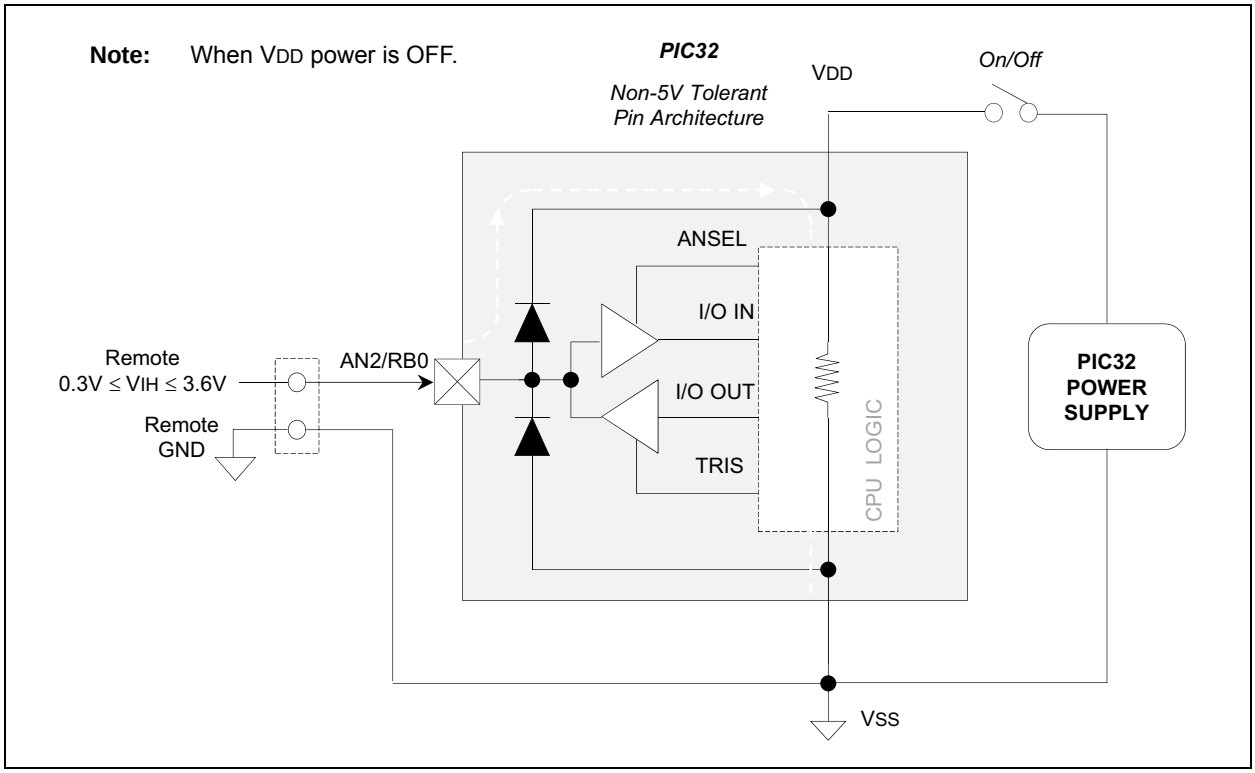
Alternatively, inputs can be reserved by connecting the pin to VSS through a 1k resistor and configuring the pin as an input.

2.9 Considerations When Interfacing to Remotely Powered Circuits

2.9.1 NON-5V TOLERANT INPUT PINS

A quick review of the absolute maximum rating section in **36.0 "Electrical Characteristics"** will indicate that the voltage on any non-5v tolerant pin may not exceed VDD + 0.3V unless the input current is limited to meet the respective injection current specifications defined by parameters DI60a, DI60b, and DI60c in **Table 36-10: "DC Characteristics: I/O Pin Input Injection current Specifications"**. Figure 2-5 shows an example of a remote circuit using an independent power source, which is powered while connected to a PIC32 non-5V tolerant circuit that is not powered.

FIGURE 2-5: PIC32 NON-5V TOLERANT CIRCUIT EXAMPLE



3.0 CPU

Note 1: This data sheet summarizes the features of the PIC32MK GP/MC family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 50. "CPU for Devices with MIPS32® microAptiv™ and M-Class Cores"** (DS60001192) of the *"PIC32 Family Reference Manual"*, which is available from the Microchip web site (www.microchip.com/PIC32).

2: The microAptiv™ CPU core resources are available at: www.imgtec.com.

The MIPS32® microAptiv™ MCU Core is the heart of the PIC32MK GP/MC family device processor. The CPU fetches instructions, decodes each instruction, fetches source operands, executes each instruction and writes the results of instruction execution to the proper destinations.

Key features include:

- 5-stage pipeline
- 32-bit address and data paths
- MIPS32 Enhanced Architecture (Release 5):
  - Multiply-accumulate and multiply-subtract instructions
  - Targeted multiply instruction
  - Zero/One detect instructions
  - `WAIT` instruction
  - Conditional move instructions (`MOVN`, `MOVZ`)
  - Vectored interrupts
  - Programmable exception vector base
  - Atomic interrupt enable/disable
  - GPR shadow registers to minimize latency for interrupt handlers
  - Bit field manipulation instructions
  - Virtual memory support
- microMIPS™ compatible instruction set:
  - Improves code size density over MIPS32, while maintaining MIPS32 performance.
  - Supports all MIPS32 instructions (except branch-likely instructions)
  - Fifteen additional 32-bit instructions and 39 16-bit instructions corresponding to commonly-used MIPS32 instructions
  - Stack pointer implicit in instruction
  - MIPS32 assembly and ABI compatible
- Autonomous Multiply/Divide Unit (MDU):
  - Maximum issue rate of one 32x32 multiply per clock
  - Early-in iterative divide. Minimum 12 and maximum 38 clock latency (dividend (*rs*) sign extension-dependent)
- Power Control:
  - Minimum frequency: 0 MHz
  - Low-Power mode (triggered by `WAIT` instruction)
  - Extensive use of local gated clocks
- EJTAG Debug and Instruction Trace:
  - Support for single stepping
  - Virtual instruction and data address/value breakpoints
  - Hardware breakpoint supports both address match and address range triggering.
  - Eight instruction and four data complex breakpoints
- iFlowtrace® version 2.0 support:
  - Real-time instruction program counter
  - Special events trace capability
  - Two performance counters with 34 user-selectable countable events
  - Disabled if the processor enters Debug mode
  - Program Counter sampling
- DSP ASE Extension:
  - Native fractional format data type operations
  - Register Single Instruction Multiple Data (SIMD) operations (add, subtract, multiply, shift)
  - GPR-based shift
  - Bit manipulation
  - Compare-Pick
  - DSP Control Access
  - Indexed-Load
  - Branch
  - Multiplication of complex operands
  - Variable bit insertion and extraction
  - Virtual circular buffers
  - Arithmetic saturation and overflow handling
  - Zero-cycle overhead saturation and rounding operations
- Floating Point Unit (FPU):
  - 1985 IEEE-754 compliant Floating Point Unit
  - Supports single and double precision datatypes
  - 2008 IEEE-754 compatibility control of NaN handling and Abs/Neg instructions
  - Runs at 1:1 core/FPU clock ratio

REGISTER 5-6: NVMPWP: PROGRAM FLASH WRITE-PROTECT REGISTER

Bit Range	Bit 31/23/15/7	Bit 30/22/14/6	Bit 29/21/13/5	Bit 28/20/12/4	Bit 27/19/11/3	Bit 26/18/10/2	Bit 25/17/9/1	Bit 24/16/8/0

	PWP<15:8>							
7:0	R-0	R-0	R-0	R-0	R-0	R-0	R-0	R-0
	PWP<7:0>							

Legend:			
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31 **PWPULOCK:** Program Flash Memory Page Write-protect Unlock bit
1 = Register is not locked and can be modified
0 = Register is locked and cannot be modified
This bit is only clearable and cannot be set except by any reset.

bit 30-24 **Unimplemented:** Read as '0'

bit 23-0 **PWP<23:0>:** Flash Program Write-protect (Page) Address bits
Physical memory below address 0x1Dxxxxxx is write protected, where 'xxxxxx' is specified by PWP<23:0>. When PWP<23:0> has a value of '0', write protection is disabled for the entire program Flash. If the specified address falls within the page, the entire page and all pages below the current page will be protected.

Note: The bits in this register are only writable when the NVMKEY unlock sequence is followed.

7.1 Reset Control Registers

TABLE 7-1: RESETS REGISTER MAP

Virtual Address (BF80_#)	Register Name	Bit Range	Bits																All Resets

8.0 CPU EXCEPTIONS AND INTERRUPT CONTROLLER

Note: This data sheet summarizes the features of the PIC32MK GP/MC family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 8. "Interrupt Controller"** (DS60001108) and **Section 50. "CPU for Devices with MIPS32® microAptiv™ and M-Class Cores"** (DS60001192), which is available from the *Documentation > Reference Manual* section of the Microchip PIC32 web site (www.microchip.com/pic32).

PIC32MK GP/MC devices generate interrupt requests in response to interrupt events from peripheral modules. The Interrupt Controller module exists outside of the CPU and prioritizes the interrupt events before presenting them to the CPU.

The CPU handles interrupt events as part of the exception handling mechanism, which is described in **8.1 "CPU Exceptions"**.

The Interrupt Controller module includes the following features:

- Up to 216 interrupt sources and vectors with dedicated programmable offsets, eliminating the need for redirection
- Single and multi-vector mode operations
- Five external interrupts with edge polarity control
- Interrupt proximity timer
- Seven user-selectable priority levels for each vector
- Four user-selectable subpriority levels within each priority
- Two shadow register sets that can be used for any priority level, eliminating software context switch and reducing interrupt latency
- Software can generate any interrupt

Table 8-1 provides Interrupt Service routine (ISR) latency information.

TABLE 8-2: MIPS32® microAptiv™ MCU CORE EXCEPTION TYPES (CONTINUED)

Exception Type (In Order of Priority)	Description	Branches to	Status Bits Set	Debug Bits Set	EXCCODE	XC32 Function Name
AdEL	Load address alignment error. User mode load reference to kernel address.	EBASE+0x180	EXL	—	0x04	_general_exception_handler
AdES	Store address alignment error. User mode store to kernel address.	EBASE+0x180	EXL	—	0x05	_general_exception_handler
DBE	Load or store bus error.	EBASE+0x180	EXL	—	0x07	_general_exception_handler
DDBL	EJTAG data hardware breakpoint matched in load data compare.	0xBFC0_0480	—	DDBL	—	—
CBrk	EJTAG complex breakpoint.	0xBFC0_0480	—	DIBIMPR, DDBLIMPR, and/or DDBSIMPR	—	—
Lowest Priority						

TABLE 8-4: INTERRUPT REGISTER MAP (CONTINUED)

Virtual Address (BF81_#)	Register Name(1)	Bit Range	Bits																All Resets

		15:0	VOFF<15:1>															—	0000
0910	OFF244	31:16	—	—	—	—	—	—	—	—	—	—	—	—	—	—	VOFF<17:16>		0000
		15:0	VOFF<15:1>															—	0000
0914	OFF245	31:16	—	—	—	—	—	—	—	—	—	—	—	—	—	—	VOFF<17:16>		0000
		15:0	VOFF<15:1>															—	0000
0918	OFF246	31:16	—	—	—	—	—	—	—	—	—	—	—	—	—	—	VOFF<17:16>		0000
		15:0	VOFF<15:1>															—	0000
0938	OFF254	31:16	—	—	—	—	—	—	—	—	—	—	—	—	—	—	VOFF<17:16>		0000
		15:0	VOFF<15:1>															—	0000

Legend: x = unknown value on Reset; — = unimplemented, read as '0'. Reset values are shown in hexadecimal.

Note 1: All registers in this table with the exception of the OFFx registers, have corresponding CLR, SET, and INV registers at their virtual addresses, plus offsets of 0x4, 0x8, and 0xC, respectively. See **13.2 "CLR, SET, and INV Registers"** for more information.

2: This bit is not available on 64-pin devices.

3: This bit is not available on devices without a CAN module.

4: This bit is not available on 100-pin devices.

5: Bits 31 and 30 are not available on 64-pin and 100-pin devices; bits 29 through 14 are not available on 64-pin devices.

6: Bits 31, 30, 29, and bits 5 through 0 are not available on 64-pin and 100-pin devices; bit 22 is not available on 64-pin devices.

7: The IFSx bits, as with all interrupt flag status register bits, are set as long as the peripheral is enabled and an interrupt condition event occurs. Interrupts do not have to be enabled for the IFSx bits to be set. If the user application does not want to use an interrupt, it can poll the corresponding peripheral IFSx bit to see whether an interrupt condition has occurred. The IFSx bits are persistent, they must be cleared if they are set by user software after an IFSx user bit interrogation.

12.0 USB ON-THE-GO (OTG)

Note: This data sheet summarizes the features of the PIC32MK GP/MC Family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 27. "USB On-The-Go (OTG)"** (DS60001126), which is available from the *Documentation* > *Reference Manual* section of the Microchip PIC32 web site (www.microchip.com/pic32).

The Universal Serial Bus (USB) module contains analog and digital components to provide a USB 2.0 full-speed and low-speed embedded host, full-speed device or OTG implementation with a minimum of external components. This module in Host mode is intended for use as an embedded host and therefore does not implement a UHCI or OHCI controller.

The USB module consists of the clock generator, the USB voltage comparators, the transceiver, the Serial Interface Engine (SIE), a dedicated USB DMA controller, pull-up and pull-down resistors, and the register interface. A block diagram of the PIC32MK USB OTG module is presented in Figure 12-1.

The clock generator provides the 48 MHz clock required for USB full-speed and low-speed communication. The voltage comparators monitor the voltage on the VBUS pin to determine the state of the bus. The transceiver provides the analog translation between the USB bus and the digital logic. The SIE is a state machine that transfers data to and from the endpoint buffers and generates the hardware protocol for data transfers. The USB DMA controller transfers data between the data buffers in RAM and the SIE. The integrated pull-up and pull-down resistors eliminate the need for external signaling components. The register interface allows the CPU to configure and communicate with the module.

The PIC32MK USB module includes the following features:

- USB full-speed support for host and device
- Low-speed host support
- USB OTG support
- Integrated signaling resistors
- Integrated analog comparators for VBUS monitoring
- Integrated USB transceiver
- Transaction handshaking performed by hardware
- Endpoint buffering anywhere in system RAM
- Integrated DMA to access system RAM and Flash

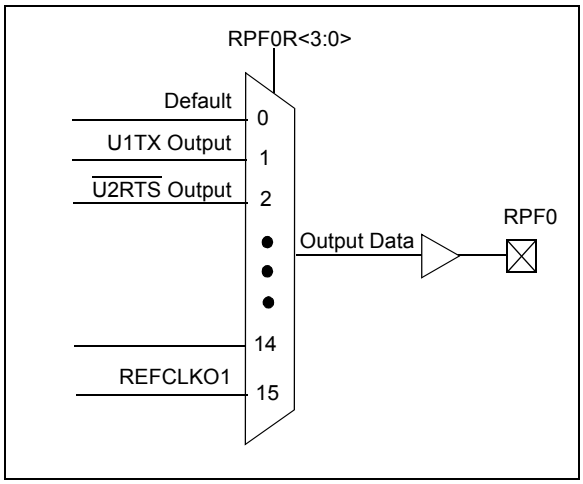
Note: The implementation and use of the USB specifications, and other third party specifications or technologies, may require licensing; including, but not limited to, USB Implementers Forum, Inc. (also referred to as USB-IF). The user is fully responsible for investigating and satisfying any applicable licensing obligations.

13.3.5 OUTPUT MAPPING

In contrast to inputs, the outputs of the PPS options are mapped on the basis of the pin. In this case, a control register associated with a particular pin dictates the peripheral output to be mapped. The RPnR registers (Register 13-2) are used to control output mapping. Like the [*pin name*]R registers, each register contains sets of 4 bit fields. The value of the bit field corresponds to one of the peripherals, and that peripheral's output is mapped to the pin (see Table 13-2 and Figure 13-3).

A null output is associated with the output register reset value of '0'. This is done to ensure that remappable outputs remain disconnected from all output pins by default.

FIGURE 13-3: EXAMPLE OF MULTIPLEXING OF REMAPPABLE OUTPUT FOR RPF0



13.3.6 CONTROLLING CONFIGURATION CHANGES

Because peripheral remapping can be changed during run time, some restrictions on peripheral remapping are needed to prevent accidental configuration changes. The PIC32MK GP/MC devices include two features to prevent alterations to the peripheral map:

- Control register lock sequence
- Configuration bit select lock

13.3.6.1 Control Register Lock

Under normal operation, writes to the RPnR and [*pin name*]R registers are not allowed. Attempted writes appear to execute normally, but the contents of the registers remain unchanged. To change these registers, they must be unlocked in hardware. The register lock is controlled by the IOLOCK Configuration bit (CFGCON<13>). Setting the IOLOCK bit prevents writes to the control registers and clearing the IOLOCK bit allows writes.

To set or clear the IOLOCK bit, an unlock sequence must be executed. Refer to the **Section 42. "Oscillators with Enhanced PLL"** (DS60001250) in the *"PIC32 Family Reference Manual"* for details.

13.3.6.2 Configuration Bit Select Lock

As an additional level of safety, the device can be configured to prevent more than one write session to the RPnR and [*pin name*]R registers. The IOL1WAY Configuration bit (DEVCFG3<29>) blocks the IOLOCK bit from being cleared after it has been set once. If the IOLOCK bit remains set, the register unlock procedure does not execute, and the PPS control registers cannot be written to. The only way to clear the bit and re-enable peripheral remapping is to perform a device Reset.

In the default (unprogrammed) state, IOL1WAY is set, restricting users to one write session.

REGISTER 25-7: ADCIMCON3: ADC INPUT MODE CONTROL REGISTER 3 (CONTINUED)

bit 15 **DIFF39:** AN39 Mode bit(1)
1 = Selects AN39 differential input pair as AN39+ and AN1-
0 = AN39 is using Single-ended mode

bit 14 **SIGN39:** AN39 Signed Data Mode bit(1)
1 = AN39 is using Signed Data mode
0 = AN39 is using Unsigned Data mode

bit 13 **DIFF38:** AN38 Mode bit(1)
1 = Selects AN38 differential input pair as AN38+ and AN1-
0 = AN38 is using Single-ended mode

bit 12 **SIGN38:** AN38 Signed Data Mode bit(1)
1 = AN38 is using Signed Data mode
0 = AN38 is using Unsigned Data mode

bit 11 **DIFF37:** AN37 Mode bit(1)
1 = Selects AN37 differential input pair as AN37+ and AN1-
0 = AN37 is using Single-ended mode

bit 10 **SIGN37:** AN37 Signed Data Mode bit(1)
1 = AN37 is using Signed Data mode
0 = AN37 is using Unsigned Data mode

bit 9 **DIFF36:** AN36 Mode bit(1)
1 = Selects AN36 differential input pair as AN36+ and AN1-
0 = AN36 is using Single-ended mode

bit 8 **SIGN36:** AN36 Signed Data Mode bit(1)
1 = AN36 is using Signed Data mode
0 = AN36 is using Unsigned Data mode

bit 7 **DIFF35:** AN35 Mode bit(1)
1 = Selects AN35 differential input pair as AN35+ and AN1-
0 = AN35 is using Single-ended mode

bit 6 **SIGN35:** AN35 Signed Data Mode bit(1)
1 = AN35 is using Signed Data mode
0 = AN35 is using Unsigned Data mode

bit 5 **DIFF34:** AN34 Mode bit(1)
1 = Selects AN34 differential input pair as AN34+ and AN1-
0 = AN34 is using Single-ended mode

bit 4 **SIGN34:** AN34 Signed Data Mode bit(1)
1 = AN34 is using Signed Data mode
0 = AN34 is using Unsigned Data mode

bit 3 **DIFF33:** AN33 Mode bit(1)
1 = Selects AN33 differential input pair as AN33+ and AN1-
0 = AN33 is using Single-ended mode

bit 2 **SIGN33:** AN33 Signed Data Mode bit(1)
1 = AN33 is using Signed Data mode
0 = AN33 is using Unsigned Data mode

bit 1-0 **Unimplemented:** Read as '0'

Note 1: This bit is not available on 64-pin devices.

-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-0 **CxFIFOUAn<31:0>:** CANx FIFO User Address bits

TXEN = 1: (FIFO configured as a transmit buffer)

A read of this register will return the address where the next message is to be written (FIFO head).

TXEN = 0: (FIFO configured as a receive buffer)

A read of this register will return the address where the next message is to be read (FIFO tail).

Note 1: This bit will always read '0', which forces byte-alignment of messages.

Note: This register is not guaranteed to read correctly in Configuration mode, and should only be accessed when the module is not in Configuration mode.

REGISTER 27-2: CMxCON: OP AMP/COMPARATOR 'x' CONTROL REGISTER ('x' = 1-5)

R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-23 **Unimplemented:** Read as '0'

bit 22-20 **CFSEL<2:0>:** Comparator Output Filter Clock Source Select bits
- 111 = PBCLK2/Timer5 Period Value (PR5)
- 110 = PBCLK2/Timer4 Period Value (PR4)
- 101 = PBCLK2/Timer3 Period Value (PR3)
- 100 = PBCLK2/Timer2 Period Value (PR2)
- 011 = REFCLK3 Clock
- 010 = PWM Secondary Special Event
- 001 = PPBCLK2 Clock
- 000 = SYSCLK Clock

bit 19 **CFLTREN:** Comparator Output Digital Filter Enable bit
- 1 = Digital Filters enabled
- 0 = Digital Filters disabled

bit 18-16 **CFDIV<2:0>:** Comparator Output Filter Clock Divide Select bits

These bits are based on the CFSEL clock source selection.
- 111 = 1:128 Clock Divide
- 110 = 1:64 Clock Divide
- 101 = 1:32 Clock Divide
- 100 = 1:16 Clock Divide
- 011 = 1:8 Clock Divide
- 010 = 1:4 Clock Divide
- 001 = 1:2 Clock Divide
- 000 = 1:1 Clock Divide

bit 15 **ON:** Comparator Enable bit
- 1 = Comparator is enabled
- 0 = Comparator is disabled

Note 1: Before attempting to initialize or enable any of the Op amp bit, the user application must clear the corresponding OPA5MD, OPA3MD, OPA2MD, and OPA1MD bits in the PMD register.

Note: The IFSx bits, as with all interrupt flag status register bits, are set as long as the peripheral is enabled and an interrupt condition event occurs. Interrupts do not have to be enabled for the IFSx bits to be set. If the user application does not want to use an interrupt, it can poll the corresponding peripheral IFSx bit to see whether an interrupt condition is occurred. The IFSx bits are persistent, so they must be cleared if they are set by user software after an IFSx user bit interrogation.

15:8	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0
	PENH(1)	PENL(1)	POLH(2)	POLL(2)	PMOD<1:0>(2)		OVRENH	OVRENL
7:0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0
	OVRDAT<1:0>(3)		FLTDAT<1:0>(2,3)		CLDAT<1:0>		SWAP	OSYNC

Legend:			
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 31-30 **Unimplemented:** Read as '0'

Note 1: During PWM initialization, if the PWMLOCK fuse bit is 'enabled' (logic '0'), the control on the state of the PWMxL/PWMxH output pins rests solely with the PENH and PENL bits. However, these bits are at '0', which leaves the pin control with the I/O module. Care must be taken to not inadvertently set the TRIS bits to output, which could impose an incorrect output on the PWMxH/PWMxL pins even if there are external pull-up and pull-down resistors. The data direction for the pins must be set to input if tri-state behavior is desired or be driven to the appropriate logic states. The PENH and PENL bits must always be initialized prior to enabling the MCPWM module (PTEN bit = 1).

2: These bits must not be changed after the MCPWM module is enabled (PTEN bit = 1).

3: State represents Active/Inactive state of the PWM, depending on the POLH and POLL bits. For example, if FLTDAT<1> is set to '1' and POLH is set to '1', the PWMxH pin will be at logic level 0 (active level) when a Fault occurs.

4: If (PWMLOCK = 0), these bits are writable only after the proper sequence is written to the PWMKEY register. If (PWMLOCK = 1), these bits are writable at all times. The user application must write two consecutive values of (0xABCD and 0x4321) to the PWMKEY register to perform the unlock operation for the IOCONx register if PWMLOCK = 1. Write access to a IOCONx register must be the next SFR access following the unlock process. There can be no other SFR accesses during the unlock process and subsequent write access. This is not an atomic operation, and therefore, any CPU interrupts that occur during or immediately after an unlock sequence may cause the IOCONx SFR write access to fail.

Note: Dead Time Compensation, Current-Limit, and Faults share common inputs on the FLTx inputs ('x' = 1-8, and 15). Therefore, it is not recommended that a user application assign these multiple functions on the same Fault FLTx pin. In addition, DTCMP functions are fixed to specific FLTx inputs, where Current-Limit, (CLSRC<3:0> bits) and Faults (FLTSRC<3:0> bits) can be assigned to any one of 15 unique and separate inputs. For example, if a user application was required to assign multiple simultaneous Fault, Current-Limit, DTCMP to a single PWM1. Refer to the following examples for both desirable and undesirable practices.

Desirable Example PWM1: (DTCMP1 = FLT3 pin, Current Limit = FLT7 pin, Fault = FLT8 pin)

```
PWMCON1bits.DTC = 0b11;       //Enable DTCMP1 input on FLT3 function pin
IOCON1bits.CLMOD = 1;         //Enable PWM1 Current-Limit mode
IOCON1bits.CLSRC = 0b0110;    //Enable current limit for PWM1 on FLT7 pin
IOCON1bits.FLTMOD = 1;        //Enable PWM1 Fault mode
IOCON1bits.FLTSRC = 0b0111;   //Enable Fault for PWM1 on FLT8 pin
```

Undesirable Example: PWM1: (DTCMP1 = Current Limit = Fault = FLT3 pin)

```
PWMCON1bits.DTC = 0b11;       //Enable DTCMP1 input on FLT3 function pin
IOCON1bits.CLMOD = 1;         //Enable PWM1 Current-Limit mode
IOCON1bits.CLSRC = 0b0010;    //Enable current limit for PWM1 on FLT3 pin
IOCON1bits.FLTMOD = 1;        //Enable PWM1 Fault mode
IOCON1bits.FLTSRC = 0b0010;   //Enable Fault for PWM1 on FLT3 pin
```

REGISTER 31-21: STRIGx: SECONDARY PWM TRIGGER COMPARE REGISTER 'x' ('x' = 1 THROUGH 12)

•
•
0001 = PWM1H selected as CHOP clock source
0000 = Chop clock generator selected as CHOP clock source

bit 1 **CHOPHEN:** PWMxH Output Chopping Enable bit

1 = PWMxH chopping function is enabled
0 = PWMxH chopping function is disabled

bit 0 **CHOPLEN:** PWMxL Output Chopping Enable bit

1 = PWMxL chopping function is enabled
0 = PWMxL chopping function is disabled

Note 1: This bit should be changed only when the PTEN bit (PTCON<15>) = 0.

35.2 MPLAB XC Compilers

The MPLAB XC Compilers are complete ANSI C compilers for all of Microchip's 8, 16, and 32-bit MCU and DSC devices. These compilers provide powerful integration capabilities, superior code optimization and ease of use. MPLAB XC Compilers run on Windows, Linux or MAC OS X.

For easy source level debugging, the compilers provide debug information that is optimized to the MPLAB X IDE.

The free MPLAB XC Compiler editions support all devices and commands, with no time or memory restrictions, and offer sufficient code optimization for most applications.

MPLAB XC Compilers include an assembler, linker and utilities. The assembler generates relocatable object files that can then be archived or linked with other relocatable object files and archives to create an executable file. MPLAB XC Compiler uses the assembler to produce its object file. Notable features of the assembler include:

- Support for the entire device instruction set
- Support for fixed-point and floating-point data
- Command-line interface
- Rich directive set
- Flexible macro language
- MPLAB X IDE compatibility

35.3 MPASM Assembler

The MPASM Assembler is a full-featured, universal macro assembler for PIC10/12/16/18 MCUs.

The MPASM Assembler generates relocatable object files for the MPLINK Object Linker, Intel® standard HEX files, MAP files to detail memory usage and symbol reference, absolute LST files that contain source lines and generated machine code, and COFF files for debugging.

The MPASM Assembler features include:

- Integration into MPLAB X IDE projects
- User-defined macros to streamline assembly code
- Conditional assembly for multipurpose source files
- Directives that allow complete control over the assembly process

35.4 MPLINK Object Linker/ MPLIB Object Librarian

The MPLINK Object Linker combines relocatable objects created by the MPASM Assembler. It can link relocatable objects from precompiled libraries, using directives from a linker script.

The MPLIB Object Librarian manages the creation and modification of library files of precompiled code. When a routine from a library is called from a source file, only the modules that contain that routine will be linked in with the application. This allows large libraries to be used efficiently in many different applications.

The object linker/library features include:

- Efficient linking of single libraries instead of many smaller files
- Enhanced code maintainability by grouping related modules together
- Flexible creation of libraries with easy module listing, replacement, deletion and extraction

35.5 MPLAB Assembler, Linker and Librarian for Various Device Families

MPLAB Assembler produces relocatable machine code from symbolic assembly language for PIC24, PIC32 and dsPIC DSC devices. MPLAB XC Compiler uses the assembler to produce its object file. The assembler generates relocatable object files that can then be archived or linked with other relocatable object files and archives to create an executable file. Notable features of the assembler include:

- Support for the entire device instruction set
- Support for fixed-point and floating-point data
- Command-line interface
- Rich directive set
- Flexible macro language
- MPLAB X IDE compatibility
