Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

		Fast POR (PORSEL=1)	0.05	—	4	ms

Notes to Table 1–6:

(1) Altera recommends a 3.0-V nominal battery voltage when connecting V_{CCBAT} to a battery for volatile key backup. If you do not use the volatile security key, you may connect the V_{CCBAT} to either GND or a 3.0-V power supply.

(2) V_{CCPD} must be 2.5 V when V_{CCIO} is 2.5, 1.8, 1.5, or 1.2 V. V_{CCPD} must be 3.0 V when V_{CCIO} is 3.0 V.

(3) n = 0, 1, or 2.

(4) $V_{CCA\_L/R}$ must be connected to a 3.0-V supply if the clock multiplier unit (CMU) phase-locked loop (PLL), receiver clock data recovery (CDR), or both, are configured at a base data rate > 4.25 Gbps. For data rates up to 4.25 Gbps, you can connect $V_{CCA\_L/R}$ to either 3.0 V or 2.5 V.

(5) $V_{CCH\_GXBL/R}$ must be connected to a 1.4-V supply if the transmitter channel data rate is > 6.5 Gbps. For data rates up to 6.5 Gbps, you can connect $V_{CCH\_GXBL/R}$ to either 1.4 V or 1.5 V.

(6) Transceiver power supplies do not have power-on-reset (POR) circuitry. After initial power-up, violating the transceiver power supply operating conditions could lead to unpredictable link behavior.

DC Characteristics

This section lists the supply current, I/O pin leakage current, on-chip termination (OCT) accuracy and variation, input pin capacitance, internal weak pull-up and pull-down resistance, hot socketing, and Schmitt trigger input specifications.

Supply Current

Standby current is the current the device draws after the device is configured with no inputs or outputs toggling and no activity in the device. Because these currents vary largely with the resources used, use the Microsoft Excel-based Early Power Estimator (EPE) to get supply current estimates for your design.

For more information about power estimation tools, refer to the *PowerPlay Early Power Estimator User Guide* and the *PowerPlay Power Analysis* chapter.

The calibration accuracy for calibrated series and parallel OCTs are applicable at the moment of calibration. When process, voltage, and temperature (PVT) conditions change after calibration, the tolerance may change.

Table 1–13 lists the Arria II GZ OCT without calibration resistance tolerance to PVT changes.

Table 1–13. OCT Without Calibration Resistance Tolerance Specifications for Arria II GZ Devices

Symbol	Description	Conditions (V)	Resistance Tolerance		Unit

25-Ω R_S 3.0 and 2.5	25-Ω internal series OCT without calibration	V_{CCIO} = 3.0, 2.5	± 40	± 40	%
25-Ω R_S 1.8 and 1.5	25-Ω internal series OCT without calibration	V_{CCIO} = 1.8, 1.5	± 40	± 40	%
25-Ω R_S 1.2	25-Ω internal series OCT without calibration	V_{CCIO} = 1.2	± 50	± 50	%
50-Ω R_S 3.0 and 2.5	50-Ω internal series OCT without calibration	V_{CCIO} = 3.0, 2.5	± 40	± 40	%
50-Ω R_S 1.8 and 1.5	50-Ω internal series OCT without calibration	V_{CCIO} = 1.8, 1.5	± 40	± 40	%
50-Ω R_S 1.2	50-Ω internal series OCT without calibration	V_{CCIO} = 1.2	± 50	± 50	%
100-Ω R_D 2.5	100-Ω internal differential OCT	V_{CCIO} = 2.5	± 25	± 25	%

OCT calibration is automatically performed at power up for OCT-enabled I/Os. When voltage and temperature conditions change after calibration, the resistance may change. Use Equation 1–1 and Table 1–14 to determine the OCT variation when voltage and temperature vary after power-up calibration for Arria II GX and GZ devices.

Equation 1–1. OCT Variation ***(Note 1)***

$$R_{OCT} = R_{SCAL}\left(1 + \langle\frac{dR}{dT} \times \Delta T\rangle \pm \langle\frac{dR}{dV} \times \Delta V\rangle\right)$$

Notes to Equation 1–1:

(1) R_{OCT} value calculated from Equation 1–1shows the range of OCT resistance with the variation of temperature and V_{CCIO}.

Table 1–19 lists the weak pull-up resistor values for Arria II GZ devices.

Table 1–19. Internal Weak Pull-Up Resistor for Arria II GZ Devices *(Note 1)*, *(2)*

Symbol	Description	Conditions	Min	Typ	Max	Unit
R_{PU}	Value of the I/O pin pull-up resistor before and during configuration, as well as user mode if the programmable pull-up resistor option is enabled.	V_{CCIO} = 3.0 V ±5% *(3)*	—	25	—	kΩ
		V_{CCIO} = 2.5 V ±5% *(3)*	—	25	—	kΩ
		V_{CCIO} = 1.8 V ±5% *(3)*	—	25	—	kΩ
		V_{CCIO} = 1.5 V ±5% *(3)*	—	25	—	kΩ
		V_{CCIO} = 1.2 V ±5% *(3)*	—	25	—	kΩ

Notes to Table 1–19:

(1) All I/O pins have an option to enable weak pull-up except configuration, test, and JTAG pins.

(2) The internal weak pull-down feature is only available for the JTAG TCK pin. The typical value for this internal weak pull-down resistor is approximately 25 kΩ .

(3) Pin pull-up resistance values may be lower if an external source drives the pin higher than V_{CCIO}.

Hot Socketing

Table 1–20 lists the hot-socketing specification for Arria II GX and GZ devices.

Table 1–20. Hot Socketing Specifications for Arria II Devices

Symbol	Description	Maximum
$I_{IIOPIN(DC)}$	DC current per I/O pin	300 µA
$I_{IOPIN(AC)}$	AC current per I/O pin	8 mA *(1)*
$I_{XCVRTX(DC)}$	DC current per transceiver TX pin	100 mA
$I_{XCVRRX(DC)}$	DC current per transceiver RX pin	50 mA

Note to Table 1–20:

(1) The I/O ramp rate is 10 ns or more. For ramp rates faster than 10 ns, $|I_{IOPIN}|$ = C dv/dt, in which "C" is I/O pin capacitance and "dv/dt" is slew rate.

Schmitt Trigger Input

The Arria II GX device supports Schmitt trigger input on the TDI, TMS, TCK, nSTATUS, nCONFIG, nCE, CONF_DONE, and DCLK pins. A Schmitt trigger feature introduces hysteresis to the input signal for improved noise immunity, especially for signals with slow edge rates.

Table 1–21 lists the hysteresis specifications across the supported V_{CCIO} range for Schmitt trigger inputs in Arria II GX devices.

Table 1–21. Schmitt Trigger Input Hysteresis Specifications for Arria II GX Devices

Notes to Table 1–35:

(1) The 3x speed grade is the fastest speed grade offered in the following Arria II GZ devices: EP2AGZ225, EP2AGZ300, and EP2AGZ350.

(2) The rise and fall time transition is specified from 20% to 80%.

(3) To calculate the REFCLK rms phase jitter requirement at reference clock frequencies other than 100 MHz, use the following formula: REFCLK rms phase jitter at f (MHz) = REFCLK rms phase jitter at 100 MHz * 100/f.

(4) The minimum `reconfig_clk` frequency is 2.5 MHz if the transceiver channel is configured in **Transmitter only** mode. The minimum `reconfig_clk` frequency is 37.5 MHz if the transceiver channel is configured in **Receiver only** or **Receiver and Transmitter** mode.

(5) If your design uses more than one dynamic reconfiguration controller (`altgx_reconfig`) instances to control the transceiver (`altgx`) channels physically located on the same side of the device AND if you use different `reconfig_clk` sources for these `altgx_reconfig` instances, the delta time between any two of these `reconfig_clk` sources becoming stable must not exceed the maximum specification listed.

(6) The device cannot tolerate prolonged operation at this absolute maximum.

(7) You must use the 1.1-V RX V_{ICM} setting if the input serial data standard is LVDS.

(8) The differential eye opening specification at the receiver input pins assumes that Receiver Equalization is disabled. If you enable Receiver Equalization, the receiver circuitry can tolerate a lower minimum eye opening, depending on the equalization level. Use H-Spice simulation to derive the minimum eye opening requirement with Receiver Equalization enabled.

(9) The rate matcher supports only up to ± 300 ppm.

(10) Time taken to `rx_pll_locked` goes high from `rx_analogreset` de-assertion. Refer to Figure 1–1 on page 1–33.

(11) Time for which the CDR must be kept in lock-to-reference mode after `rx_pll_locked` goes high and before `rx_locktodata` is asserted in manual mode. Refer to Figure 1–1 on page 1–33.

(12) Time taken to recover valid data after the `rx_locktodata` signal is asserted in manual mode. Refer to Figure 1–1 on page 1–33.

(13) Time taken to recover valid data after the `rx_freqlocked` signal goes high in automatic mode. Refer to Figure 1–2 on page 1–33.

(14) A GPLL may be required to meet the PMA-FPGA fabric interface timing above certain data rates. For more information, refer to the *Transceiver Clocking for Arria II Devices* chapter.

(15) The Quartus II software automatically selects the appropriate slew rate depending on the configured data rate or functional mode.

(16) To support data rates lower than the minimum specification through oversampling, use the CDR in LTR mode only.

Notes to Table 1–45:

(1) This specification is limited in the Quartus II software by the I/O maximum frequency. The maximum I/O frequency is different for each I/O standard.

(2) This specification is limited by the lower of the two: I/O F_{MAX} or F_{OUT} of the PLL.

(3) A high input jitter directly affects the PLL output jitter. To have low PLL output clock jitter, you must provide a clean clock source that is less than 120 ps.

(4) F_{REF} is fIN/N when N = 1.

(5) Peak-to-peak jitter with a probability level of 10^{-12} (14 sigma, 99.99999999974404% confidence level). The output jitter specification applies to the intrinsic jitter of the PLL, when an input jitter of 30 ps is applied. The external memory interface clock output jitter specifications use a different measurement method and are available in Table 1–64 on page 1–71.

(6) The cascaded PLL specification is only applicable with the following condition:
a. Upstream PLL: 0.59 Mhz ≤ Upstream PLL BW < 1 MHz
b. Downstream PLL: Downstream PLL BW > 2 MHz

(7) High bandwidth PLL settings are not supported in external feedback mode.

(8) External memory interface clock output jitter specifications use a different measurement method, which is available in Table 1–63 on page 1–71.

Periphery Performance

This section describes periphery performance, including high-speed I/O, external memory interface, and IOE programmable delay.

I/O performance supports several system interfaces, for example the high-speed I/O interface, external memory interface, and the PCI/PCI-X bus interface. I/O using SSTL-18 Class I termination standard can achieve up to the stated DDR2 SDRAM interfacing speed with typical DDR2 SDRAM memory interface setup. I/O using general purpose I/O (GPIO) standards such as 3.0, 2.5, 1.8, or 1.5 LVTTL/LVCMOS are capable of typical 200 MHz interfacing frequency with 10pF load.

☞ Actual achievable frequency depends on design- and system-specific factors. You should perform HSPICE/IBIS simulations based on your specific design and system setup to determine the maximum achievable frequency in your system.

Notes to Table 1–53:

(1) $f_{HSCLK\_IN} = f_{HSDR} / W$. Use W to determine the supported selection of input reference clock frequencies for the desired data rate.

(2) Applicable for interfacing with DPA receivers only. For interfacing with non-DPA receivers, you must calculate the leftover timing margin in the receiver by performing link timing closure analysis. For Arria II GX transmitter to Arria II GX non-DPA receiver, the maximum supported data rate is 945 Mbps. For data rates above 840 Mbps, perform PCB trace compensation by adjusting the PCB trace length for LVDS channels to improve channel-to-channel skews.

(3) The minimum and maximum specification depends on the clock source (for example, PLL and clock pin) and the clock routing resource you use (global, regional, or local). The I/O differential buffer and input register do not have a minimum toggle rate.

(4) The specification is only applicable under the influence of core noise.

(5) Applicable for true LVDS using dedicated SERDES only.

(6) Dedicated SERDES and DPA features are only available on the right banks.

(7) You must calculate the leftover timing margin in the receiver by performing link timing closure analysis. You must consider the board skew margin, transmitter channel-to-channel skew, and the receiver sampling margin to determine the leftover timing margin.

Table 1–54 lists the high-speed I/O timing for Arria II GZ devices.

Notes to Table 1–54:

(1) When J = 3 to 10, use the SERDES block.

(2) When J = 1 or 2, bypass the SERDES block.

(3) Clock Boost Factor (W) is the ratio between input data rate to the input clock rate.

(4) The minimum specification depends on the clock source (for example, the PLL and clock pin) and the clock routing resource (global, regional, or local) that you use. The I/O differential buffer and input register do not have a minimum toggle rate.

(5) You must calculate the leftover timing margin in the receiver by performing link timing closure analysis. You must consider the board skew margin, transmitter channel-to-channel skew, and receiver sampling margin to determine leftover timing margin.

(6) You can estimate the achievable maximum data rate for non-DPA mode by performing link timing closure analysis. You must consider the board skew margin, transmitter delay margin, and the receiver sampling margin to determine the maximum data rate supported.

(7) This is achieved by using the LVDS and DPA clock network.

(8) If the receiver with DPA enabled and transmitter are using shared PLLs, the minimum data rate is 150 Mbps.

(9) This only applies to DPA and soft-CDR modes.

(10) This only applies to LVDS source synchronous mode.
