#### [Understanding Embedded - FPGAs \(Field Programmable Gate Array\)](#)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

#### **Applications of Embedded - FPGAs**

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

#### **Details**

Product Status	Obsolete
Number of LABs/CLBs	4964
Number of Logic Elements/Cells	118143
Total RAM Bits	8315904
Number of I/O	452
Number of Gates	-
Voltage - Supply	0.87V ~ 0.93V
Mounting Type	Surface Mount
Operating Temperature	-40°C ~ 100°C (TJ)
Package / Case	1152-BBGA, FCBGA
Supplier Device Package	1152-FBGA (35x35)

## Recommended Operating Conditions

This section lists the functional operation limits for AC and DC parameters for Arria II GX and GZ devices. All supplies are required to monotonically reach their full-rail values without plateaus within  $t_{RAMP}$ .

Table 1–5 lists the recommended operating conditions for Arria II GX devices.

**Table 1–5. Recommended Operating Conditions for Arria II GX Devices (Note 1) (Part 1 of 2)**

**Notes to Table 1–6:**

- (1) Altera recommends a 3.0-V nominal battery voltage when connecting  $V_{CCBAT}$  to a battery for volatile key backup. If you do not use the volatile security key, you may connect the  $V_{CCBAT}$  to either GND or a 3.0-V power supply.
- (2)  $V_{CCPD}$  must be 2.5 V when  $V_{CCIO}$  is 2.5, 1.8, 1.5, or 1.2 V.  $V_{CCPD}$  must be 3.0 V when  $V_{CCIO}$  is 3.0 V.
- (3)  $n = 0, 1,$  or  $2.$
- (4)  $V_{CCA\_L/R}$  must be connected to a 3.0-V supply if the clock multiplier unit (CMU) phase-locked loop (PLL), receiver clock data recovery (CDR), or both, are configured at a base data rate > 4.25 Gbps. For data rates up to 4.25 Gbps, you can connect  $V_{CCA\_L/R}$  to either 3.0 V or 2.5 V.
- (5)  $V_{CCH\_GXBL/R}$  must be connected to a 1.4-V supply if the transmitter channel data rate is > 6.5 Gbps. For data rates up to 6.5 Gbps, you can connect  $V_{CCH\_GXBL/R}$  to either 1.4 V or 1.5 V.
- (6) Transceiver power supplies do not have power-on-reset (POR) circuitry. After initial power-up, violating the transceiver power supply operating conditions could lead to unpredictable link behavior.

## DC Characteristics

This section lists the supply current, I/O pin leakage current, on-chip termination (OCT) accuracy and variation, input pin capacitance, internal weak pull-up and pull-down resistance, hot socketing, and Schmitt trigger input specifications.

### Supply Current

Standby current is the current the device draws after the device is configured with no inputs or outputs toggling and no activity in the device. Because these currents vary largely with the resources used, use the Microsoft Excel-based Early Power Estimator (EPE) to get supply current estimates for your design.

 For more information about power estimation tools, refer to the *PowerPlay Early Power Estimator User Guide* and the *PowerPlay Power Analysis* chapter.

## I/O Standard Specifications

**Table 1–22** through **Table 1–35** list input voltage ( $V_{IH}$  and  $V_{IL}$ ), output voltage ( $V_{OH}$  and  $V_{OL}$ ), and current drive characteristics ( $I_{OH}$  and  $I_{OL}$ ) for various I/O standards supported by the Arria II device family. They also show the Arria II device family I/O standard specifications.  $V_{OL}$  and  $V_{OH}$  values are valid at the corresponding  $I_{OH}$  and  $I_{OL}$ , respectively.

For an explanation of terms used in **Table 1–22** through **Table 1–35**, refer to “[Glossary](#)” on page [1–74](#).

## Switching Characteristics

This section provides performance characteristics of the Arria II GX and GZ core and periphery blocks for commercial grade devices. The following tables are considered final and are based on actual silicon characterization and testing. These numbers reflect the actual performance of the device under worst-case silicon process, voltage, and junction temperature conditions.

**Table 1–39** lists typical transmitter pre-emphasis levels for Arria II GZ devices (in dB) for the first post tap under the following conditions (low-frequency data pattern [five 1s and five 0s] at 6.25 Gbps). The levels listed in **Table 1–39** are a representation of possible pre-emphasis levels under the specified conditions only and that the pre-emphasis levels may change with data pattern and data rate.

To predict the pre-emphasis level for your specific data rate and pattern, run simulations using the [Arria II HSSI HSPICE](#) models.

**Table 1–44. PLL Specifications for Arria II GX Devices (Part 3 of 3)**

<b>Symbol</b>	<b>Description</b>	<b>Min</b>	<b>Typ</b>	<b>Max</b>	<b>Unit</b>
$t_{CASC\_OUTJITTER\_PERIOD\_DEDCLK}$ <b>(6), (7)</b>	Period Jitter for dedicated clock output in cascaded PLLs ( $f_{OUT} \geq 100$ MHz)	—	—	425	ps (p-p)
	Period Jitter for dedicated clock output in cascaded PLLs ( $f_{OUT} \leq 100$ MHz)	—	—	42.5	mUI (p-p)

**Notes to Table 1–44:**

- (1)  $f_{IN}$  is limited by the I/O  $f_{MAX}$ .
- (2) The VCO frequency reported by the Quartus II software in the PLL summary section of the compilation report takes into consideration the VCO post-scale counter K value. Therefore, if the counter K has a value of 2, the frequency reported can be lower than the  $f_{VCO}$  specification.
- (3) A high-input jitter directly affects the PLL output jitter. To have low PLL output clock jitter, you must provide a clean-clock source, which is less than 200 ps.
- (4)  $F_{REF}$  is  $f_{IN}/N$  when  $N = 1$ .
- (5) This specification is limited by the lower of the two: I/O  $f_{MAX}$  or  $f_{OUT}$  of the PLL.
- (6) Peak-to-peak jitter with a probability level of  $10^{-12}$  (14 sigma, 99.999999974404% confidence level). The output jitter specification applies to the intrinsic jitter of the PLL, when an input jitter of 30 ps is applied. The external memory interface clock output jitter specifications use a different measurement method and are available in [Table 1–62 on page 1–70](#).
- (7) The cascaded PLL specification is only applicable with the following condition:
  - a. Upstream PLL:  $0.59$  MHz  $\leq$  Upstream PLL BW  $< 1$  MHz
  - b. Downstream PLL: Downstream PLL BW  $> 2$  MHz

[Table 1–45](#) lists the PLL specifications for Arria II GZ devices when operating in both the commercial junction temperature range (0° to 85°C) and the industrial junction temperature range (-40° to 100°C).

**Notes to Table 1–48:**

- (1) To achieve the maximum memory block performance, use a memory block clock that comes through global clock routing from an on-chip PLL set to 50% output duty cycle. Use the Quartus II software to report timing for this and other memory block clocking schemes.
- (2) When you use the error detection CRC feature, there is no degradation in  $F_{MAX}$ .

**Note to Table 1–58:**

- (1) Low indicates a 6-bit DQS delay setting; high indicates a 5-bit DQS delay setting.

Table 1–59 lists the DQS phase offset delay per stage for Arria II GX devices.

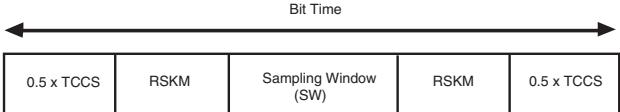

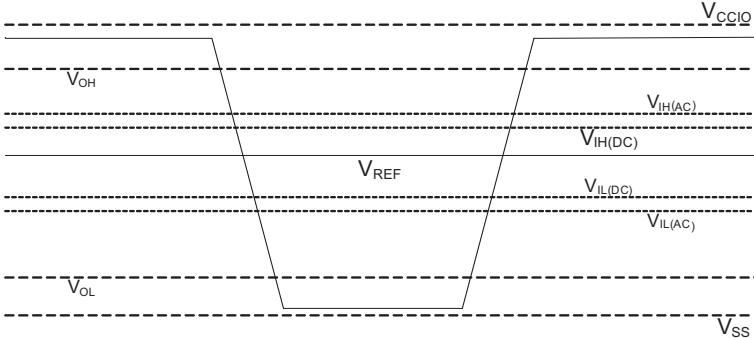

**Table 1–59. DQS Phase Offset Delay Per Setting for Arria II GX Devices (Note 1), (2), (3)**

Speed Grade	Min	Max	Unit
C4	7.0	13.0	ps
I3, C5, I5	7.0	15.0	ps
C6	8.5	18.0	ps

**Notes to Table 1–59:**

- (1) The valid settings for phase offset are -64 to +63 for frequency modes 0 to 3 and -32 to +31 for frequency modes 4 to 5.  
(2) The typical value equals the average of the minimum and maximum values.  
(3) The delay settings are linear.

Letter	Subject	Definitions
	<b>SW (sampling window)</b>	The period of time during which the data must be valid in order to capture it correctly. The setup and hold times determine the ideal strobe position within the sampling window: <i>Timing Diagram</i> 
S	Single-ended Voltage Referenced I/O Standard	The JEDEC standard for SSTL and HSTL I/O standards define both the AC and DC input signal values. The AC values indicate the voltage levels at which the receiver must meet its timing specifications. The DC values indicate the voltage levels at which the final logic state of the receiver is unambiguously defined. After the receiver input has crossed the AC value, the receiver changes to the new logic state. The new logic state is then maintained as long as the input stays beyond the AC threshold. This approach is intended to provide predictable receiver timing in the presence of input waveform ringing: <i>Single-Ended Voltage Referenced I/O Standard</i> 
T	<b>t<sub>C</sub></b>	High-speed receiver and transmitter input and output clock period.
	<b>TCCS (channel-to-channel-skew)</b>	The timing difference between the fastest and slowest output edges, including $t_{CO}$ variation and clock skew, across channels driven by the same PLL. The clock is included in the TCCS measurement (refer to the <i>Timing Diagram</i> figure under S in this table).
	<b>t<sub>DUTY</sub></b>	High-speed I/O block: Duty cycle on the high-speed transmitter output clock. <b>Timing Unit Interval (TUI)</b> The timing budget allowed for skew, propagation delays, and data sampling window. ( $TUI = 1 / (\text{Receiver Input Clock Frequency Multiplication Factor}) = t_c/w$ )
	<b>t<sub>FALL</sub></b>	Signal high-to-low transition time (80-20%)
	<b>t<sub>INCCJ</sub></b>	Cycle-to-cycle jitter tolerance on the PLL clock input.
	<b>t<sub>OUTPJ_IO</sub></b>	Period jitter on the general purpose I/O driven by a PLL.
	<b>t<sub>OUTPJ_DC</sub></b>	Period jitter on the dedicated clock output driven by a PLL.
	<b>t<sub>RISE</sub></b>	Signal low-to-high transition time (20-80%).
