Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

Details

Product Status	Obsolete
Number of LABs/CLBs	1805
Number of Logic Elements/Cells	42959
Total RAM Bits	3517440
Number of I/O	364
Number of Gates	-
Voltage - Supply	0.87V ~ 0.93V
Mounting Type	Surface Mount
Operating Temperature	0°C ~ 85°C (TJ)
Package / Case	780-BBGA, FCBGA
Supplier Device Package	780-FBGA (29x29)

T _{STG}	Storage temperature (no bias)	-65	150	°C

Note to Table 1–2:

(1) n = 0, 1, or 2.

Maximum Allowed Overshoot and Undershoot Voltage

During transitions, input signals may overshoot to the voltage shown in Table 1–3 and undershoot to –2.0 V for magnitude of currents less than 100 mA and periods shorter than 20 ns.

Table 1–3 lists the Arria II GX and GZ maximum allowed input overshoot voltage and the duration of the overshoot voltage as a percentage over the device lifetime. The maximum allowed overshoot duration is specified as a percentage of high-time over the lifetime of the device. A DC signal is equivalent to 100% duty cycle. For example, a signal that overshoots to 4.3 V can only be at 4.3 V for 5.41% over the lifetime of the device; for a device lifetime of 10 years, this amounts to 5.41/10ths of a year.

		Industrial	–40	—	100	°C
t_{RAMP}	Power supply ramp time	Normal POR (PORSEL=0)	0.05	—	100	ms
		Fast POR (PORSEL=1)	0.05	—	4	ms

Notes to Table 1-6:

- (1) Altera recommends a 3.0-V nominal battery voltage when connecting V_{CCBAT} to a battery for volatile key backup. If you do not use the volatile security key, you may connect the V_{CCBAT} to either GND or a 3.0-V power supply.
- (2) V_{CCPD} must be 2.5 V when V_{CCIO} is 2.5, 1.8, 1.5, or 1.2 V. V_{CCPD} must be 3.0 V when V_{CCIO} is 3.0 V.
- (3) $n = 0, 1, \text{ or } 2$.
- (4) $V_{CCA_L/R}$ must be connected to a 3.0-V supply if the clock multiplier unit (CMU) phase-locked loop (PLL), receiver clock data recovery (CDR), or both, are configured at a base data rate > 4.25 Gbps. For data rates up to 4.25 Gbps, you can connect $V_{CCA_L/R}$ to either 3.0 V or 2.5 V.
- (5) $V_{CCH_GXBL/R}$ must be connected to a 1.4-V supply if the transmitter channel data rate is > 6.5 Gbps. For data rates up to 6.5 Gbps, you can connect $V_{CCH_GXBL/R}$ to either 1.4 V or 1.5 V.
- (6) Transceiver power supplies do not have power-on-reset (POR) circuitry. After initial power-up, violating the transceiver power supply operating conditions could lead to unpredictable link behavior.

DC Characteristics

This section lists the supply current, I/O pin leakage current, on-chip termination (OCT) accuracy and variation, input pin capacitance, internal weak pull-up and pull-down resistance, hot socketing, and Schmitt trigger input specifications.

Supply Current

Standby current is the current the device draws after the device is configured with no inputs or outputs toggling and no activity in the device. Because these currents vary largely with the resources used, use the Microsoft Excel-based Early Power Estimator (EPE) to get supply current estimates for your design.

For more information about power estimation tools, refer to the *PowerPlay Early Power Estimator User Guide* and the *PowerPlay Power Analysis* chapter.

Use the following with Equation 1-1:

- R_{SCAL} is the OCT resistance value at power up.
- ΔT is the variation of temperature with respect to the temperature at power up.
- ΔV is the variation of voltage with respect to the V_{CCIO} at power up.
- dR/dT is the percentage change of R_{SCAL} with temperature.
- dR/dV is the percentage change of R_{SCAL} with voltage.

Table 1-14 lists the OCT variation with temperature and voltage after power-up calibration for Arria II GX devices.

Table 1-14. OCT Variation after Power-up Calibration for Arria II GX Devices

- (3) R_L range: 90 ≤ R_L ≤ 110 Ω.
- (4) The RSDS and mini-LVDS I/O standards are only supported for differential outputs.
- (5) The LVPECL input standard is supported at the dedicated clock input pins (GCLK) only.
- (6) There are no fixed V_{ICM}, V_{OD}, and V_{OCM} specifications for BLVDS. These specifications depend on the system topology.

Notes to Table 1–34:

- (1) For AC-coupled links, the on-chip biasing circuit is switched off before and during configuration. Ensure that input specifications are not violated during this period.
- (2) The rise/fall time is specified from 20% to 80%.
- (3) To calculate the REFCLK rms phase jitter requirement at reference clock frequencies other than 100 MHz, use the following formula:
REFCLK rms phase jitter at f (MHz) = REFCLK rms phase jitter at 100 MHz * 100/f.
- (4) The minimum `reconfig_clk` frequency is 2.5 MHz if the transceiver channel is configured in **Transmitter only** mode. The minimum `reconfig_clk` frequency is 37.5 MHz if the transceiver channel is configured in **Receiver only** or **Receiver and Transmitter** mode. For more information, refer to [AN 558: Implementing Dynamic Reconfiguration in Arria II Devices](#).
- (5) If your design uses more than one dynamic reconfiguration controller instances (`altgx_reconfig`) to control the transceiver channels (`altgx`) physically located on the same side of the device, and if you use different `reconfig_clk` sources for these `altgx_reconfig` instances, the delta time between any two of these `reconfig_clk` sources becoming stable must not exceed the maximum specification listed.
- (6) The device cannot tolerate prolonged operation at this absolute maximum.
- (7) You must use the 1.1-V RX V_{ICM} setting if the input serial data standard is LVDS and the link is DC-coupled.
- (8) The rate matcher supports only up to ± 300 parts per million (ppm).
- (9) Time taken to `rx_pll_locked` goes high from `rx_analogreset` de-assertion. Refer to [Figure 1–1](#).
- (10) The time in which the CDR must be kept in lock-to-reference mode after `rx_pll_locked` goes high and before `rx_locktodata` is asserted in manual mode. Refer to [Figure 1–1](#).
- (11) The time taken to recover valid data after the `rx_locktodata` signal is asserted in manual mode. Refer to [Figure 1–1](#).
- (12) The time taken to recover valid data after the `rx_freqlocked` signal goes high in automatic mode. Refer to [Figure 1–2](#).
- (13) To support data rates lower than the minimum specification through oversampling, use the CDR in LTR mode only.

Soft-CDR PPM tolerance	Soft-CDR mode	—	—	300	—	—	300	± PPM
Sampling Window (SW)	Non-DPA mode	—	—	300	—	—	300	ps

Notes to Table 1–54:

- (1) When J = 3 to 10, use the SERDES block.
- (2) When J = 1 or 2, bypass the SERDES block.
- (3) Clock Boost Factor (W) is the ratio between input data rate to the input clock rate.
- (4) The minimum specification depends on the clock source (for example, the PLL and clock pin) and the clock routing resource (global, regional, or local) that you use. The I/O differential buffer and input register do not have a minimum toggle rate.
- (5) You must calculate the leftover timing margin in the receiver by performing link timing closure analysis. You must consider the board skew margin, transmitter channel-to-channel skew, and receiver sampling margin to determine leftover timing margin.
- (6) You can estimate the achievable maximum data rate for non-DPA mode by performing link timing closure analysis. You must consider the board skew margin, transmitter delay margin, and the receiver sampling margin to determine the maximum data rate supported.
- (7) This is achieved by using the LVDS and DPA clock network.
- (8) If the receiver with DPA enabled and transmitter are using shared PLLs, the minimum data rate is 150 Mbps.
- (9) This only applies to DPA and soft-CDR modes.
- (10) This only applies to LVDS source synchronous mode.

Table 1–55 lists DPA lock time specifications for Arria II GX and GZ devices.

Figure 1-6 shows the LVDS soft-CDR/DPA sinusoidal jitter tolerance specification for Arria II GZ devices at 1.25 Gbps data rate.

I/O Timing

Altera offers two ways to determine I/O timing:

- Using the Microsoft Excel-based I/O Timing.
- Using the Quartus II Timing Analyzer.

The Microsoft Excel-based I/O Timing provides pin timing performance for each device density and speed grade. The data is typically used prior to designing the FPGA to get an estimate of the timing budget as part of the link timing analysis. The Quartus II timing analyzer provides a more accurate and precise I/O timing data based on the specifics of the design after place-and-route is complete.

The Microsoft Excel-based I/O Timing spreadsheet is downloadable from the [Literature: Arria II Devices](#) web page.
