Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Notes to Table 1–6:

(1) Altera recommends a 3.0-V nominal battery voltage when connecting V_{CCBAT} to a battery for volatile key backup. If you do not use the volatile security key, you may connect the V_{CCBAT} to either GND or a 3.0-V power supply.

(2) V_{CCPD} must be 2.5 V when V_{CCIO} is 2.5, 1.8, 1.5, or 1.2 V. V_{CCPD} must be 3.0 V when V_{CCIO} is 3.0 V.

(3) n = 0, 1, or 2.

(4) $V_{CCA\_L/R}$ must be connected to a 3.0-V supply if the clock multiplier unit (CMU) phase-locked loop (PLL), receiver clock data recovery (CDR), or both, are configured at a base data rate > 4.25 Gbps. For data rates up to 4.25 Gbps, you can connect $V_{CCA\_L/R}$ to either 3.0 V or 2.5 V.

(5) $V_{CCH\_GXBL/R}$ must be connected to a 1.4-V supply if the transmitter channel data rate is > 6.5 Gbps. For data rates up to 6.5 Gbps, you can connect $V_{CCH\_GXBL/R}$ to either 1.4 V or 1.5 V.

(6) Transceiver power supplies do not have power-on-reset (POR) circuitry. After initial power-up, violating the transceiver power supply operating conditions could lead to unpredictable link behavior.

DC Characteristics

This section lists the supply current, I/O pin leakage current, on-chip termination (OCT) accuracy and variation, input pin capacitance, internal weak pull-up and pull-down resistance, hot socketing, and Schmitt trigger input specifications.

Supply Current

Standby current is the current the device draws after the device is configured with no inputs or outputs toggling and no activity in the device. Because these currents vary largely with the resources used, use the Microsoft Excel-based Early Power Estimator (EPE) to get supply current estimates for your design.

For more information about power estimation tools, refer to the *PowerPlay Early Power Estimator User Guide* and the *PowerPlay Power Analysis* chapter.

(2) The internal weak pull-down feature is only available for the JTAG TCK pin. The typical value for this internal weak pull-down resistor is approximately 25 kΩ .

(3) Pin pull-up resistance values may be lower if an external source drives the pin higher than V_{CCIO}.

Hot Socketing

Table 1–20 lists the hot-socketing specification for Arria II GX and GZ devices.

Table 1–20. Hot Socketing Specifications for Arria II Devices

Symbol	Description	Maximum
$I_{IIOPIN(DC)}$	DC current per I/O pin	300 µA

$I_{XCVRRX(DC)}$	DC current per transceiver RX pin	50 mA

Note to Table 1–20:

(1) The I/O ramp rate is 10 ns or more. For ramp rates faster than 10 ns, $|I_{IOPIN}|$ = C dv/dt, in which "C" is I/O pin capacitance and "dv/dt" is slew rate.

Schmitt Trigger Input

The Arria II GX device supports Schmitt trigger input on the TDI, TMS, TCK, nSTATUS, nCONFIG, nCE, CONF_DONE, and DCLK pins. A Schmitt trigger feature introduces hysteresis to the input signal for improved noise immunity, especially for signals with slow edge rates.

Table 1–21 lists the hysteresis specifications across the supported V_{CCIO} range for Schmitt trigger inputs in Arria II GX devices.

I/O Timing

Altera offers two ways to determine I/O timing:

- Using the Microsoft Excel-based I/O Timing.
- Using the Quartus II Timing Analyzer.

The Microsoft Excel-based I/O Timing provides pin timing performance for each device density and speed grade. The data is typically used prior to designing the FPGA to get an estimate of the timing budget as part of the link timing analysis. The Quartus II timing analyzer provides a more accurate and precise I/O timing data based on the specifics of the design after place-and-route is complete.

The Microsoft Excel-based I/O Timing spreadsheet is downloadable from the Literature: Arria II Devices web page.
