Understanding [Embedded - FPGAs \(Field Programmable Gate Array\)](#)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

- (3) Pin pull-up resistance values may be lower if an external source drives the pin higher than V_{CCIO}.

Hot Socketing

Table 1-20 lists the hot-socketing specification for Arria II GX and GZ devices.

Table 1-20. Hot Socketing Specifications for Arria II Devices

Symbol	Description	Maximum

Note to Table 1-20:

- (1) The I/O ramp rate is 10 ns or more. For ramp rates faster than 10 ns, |I_{IOPIN}| = C dv/dt, in which “C” is I/O pin capacitance and “dv/dt” is slew rate.

Schmitt Trigger Input

The Arria II GX device supports Schmitt trigger input on the TDI, TMS, TCK, nSTATUS, nCONFIG, nCE, CONF_DONE, and DCLK pins. A Schmitt trigger feature introduces hysteresis to the input signal for improved noise immunity, especially for signals with slow edge rates.

Table 1-21 lists the hysteresis specifications across the supported V_{CCIO} range for Schmitt trigger inputs in Arria II GX devices.

Digital reset pulse width	—	Minimum is 2 parallel clock cycles												

Notes to Table 1–34:

- (1) For AC-coupled links, the on-chip biasing circuit is switched off before and during configuration. Ensure that input specifications are not violated during this period.
- (2) The rise/fall time is specified from 20% to 80%.
- (3) To calculate the REFCLK rms phase jitter requirement at reference clock frequencies other than 100 MHz, use the following formula:
REFCLK rms phase jitter at f (MHz) = REFCLK rms phase jitter at 100 MHz * 100/f.
- (4) The minimum `reconfig_clk` frequency is 2.5 MHz if the transceiver channel is configured in **Transmitter only** mode. The minimum `reconfig_clk` frequency is 37.5 MHz if the transceiver channel is configured in **Receiver only** or **Receiver and Transmitter** mode. For more information, refer to [AN 558: Implementing Dynamic Reconfiguration in Arria II Devices](#).
- (5) If your design uses more than one dynamic reconfiguration controller instances (`altgx_reconfig`) to control the transceiver channels (`altgx`) physically located on the same side of the device, and if you use different `reconfig_clk` sources for these `altgx_reconfig` instances, the delta time between any two of these `reconfig_clk` sources becoming stable must not exceed the maximum specification listed.
- (6) The device cannot tolerate prolonged operation at this absolute maximum.
- (7) You must use the 1.1-V RX V_{ICM} setting if the input serial data standard is LVDS and the link is DC-coupled.
- (8) The rate matcher supports only up to ± 300 parts per million (ppm).
- (9) Time taken to `rx_pll_locked` goes high from `rx_analogreset` de-assertion. Refer to [Figure 1–1](#).
- (10) The time in which the CDR must be kept in lock-to-reference mode after `rx_pll_locked` goes high and before `rx_locktodata` is asserted in manual mode. Refer to [Figure 1–1](#).
- (11) The time taken to recover valid data after the `rx_locktodata` signal is asserted in manual mode. Refer to [Figure 1–1](#).
- (12) The time taken to recover valid data after the `rx_freqlocked` signal goes high in automatic mode. Refer to [Figure 1–2](#).
- (13) To support data rates lower than the minimum specification through oversampling, use the CDR in LTR mode only.
