[Understanding Embedded - FPGAs \(Field Programmable Gate Array\)](#)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

The calibration accuracy for calibrated series and parallel OCTs are applicable at the moment of calibration. When process, voltage, and temperature (PVT) conditions change after calibration, the tolerance may change.

Table 1–13 lists the Arria II GZ OCT without calibration resistance tolerance to PVT changes.

Table 1–13. OCT Without Calibration Resistance Tolerance Specifications for Arria II GZ Devices

OCT calibration is automatically performed at power up for OCT-enabled I/Os. When voltage and temperature conditions change after calibration, the resistance may change. Use [Equation 1–1](#) and [Table 1–14](#) to determine the OCT variation when voltage and temperature vary after power-up calibration for Arria II GX and GZ devices.

Equation 1–1. OCT Variation ([Note 1](#))

$$R_{OCT} = R_{SCAL} \left(1 + \langle \frac{dR}{dT} \times \Delta T \rangle \pm \langle \frac{dR}{dV} \times \Delta V \rangle \right)$$

Notes to Equation 1–1:

- (1) R_{OCT} value calculated from [Equation 1–1](#) shows the range of OCT resistance with the variation of temperature and V_{CCIO} .

Table 1–19 lists the weak pull-up resistor values for Arria II GZ devices.

Table 1–19. Internal Weak Pull-Up Resistor for Arria II GZ Devices (Note 1), (2)

Symbol	Description	Conditions	Min	Typ	Max	Unit
R_{PU}	Value of the I/O pin pull-up resistor before and during configuration, as well as user mode if the programmable pull-up resistor option is enabled.	$V_{CCIO} = 3.0 \text{ V} \pm 5\% \text{ (3)}$	—	25	—	$\text{k}\Omega$
		$V_{CCIO} = 2.5 \text{ V} \pm 5\% \text{ (3)}$	—	25	—	$\text{k}\Omega$
		$V_{CCIO} = 1.8 \text{ V} \pm 5\% \text{ (3)}$	—	25	—	$\text{k}\Omega$
		$V_{CCIO} = 1.5 \text{ V} \pm 5\% \text{ (3)}$	—	25	—	$\text{k}\Omega$
		$V_{CCIO} = 1.2 \text{ V} \pm 5\% \text{ (3)}$	—	25	—	$\text{k}\Omega$

Notes to Table 1–19:

- (1) All I/O pins have an option to enable weak pull-up except configuration, test, and JTAG pins.
- (2) The internal weak pull-down feature is only available for the JTAG TCK pin. The typical value for this internal weak pull-down resistor is approximately 25 $\text{k}\Omega$.
- (3) Pin pull-up resistance values may be lower if an external source drives the pin higher than V_{CCIO} .

Hot Socketing

Table 1–20 lists the hot-socketing specification for Arria II GX and GZ devices.

Table 1–20. Hot Socketing Specifications for Arria II Devices

Symbol	Description	Maximum
$I_{IOPIN(DC)}$	DC current per I/O pin	300 μA
$I_{IOPIN(AC)}$	AC current per I/O pin	8 mA (1)
$I_{XCVRTX(DC)}$	DC current per transceiver TX pin	100 mA
$I_{XCVRRX(DC)}$	DC current per transceiver RX pin	50 mA

Note to Table 1–20:

- (1) The I/O ramp rate is 10 ns or more. For ramp rates faster than 10 ns, $|I_{IOPIN}| = C \frac{dv}{dt}$, in which “C” is I/O pin capacitance and “dv/dt” is slew rate.

Schmitt Trigger Input

The Arria II GX device supports Schmitt trigger input on the TDI, TMS, TCK, nSTATUS, nCONFIG, nCE, CONF_DONE, and DCLK pins. A Schmitt trigger feature introduces hysteresis to the input signal for improved noise immunity, especially for signals with slow edge rates.

Table 1–21 lists the hysteresis specifications across the supported V_{CCIO} range for Schmitt trigger inputs in Arria II GX devices.

Table 1–21. Schmitt Trigger Input Hysteresis Specifications for Arria II GX Devices

Notes to Table 1–35:

- (1) The 3x speed grade is the fastest speed grade offered in the following Arria II GZ devices: EP2AGZ225, EP2AGZ300, and EP2AGZ350.
- (2) The rise and fall time transition is specified from 20% to 80%.
- (3) To calculate the REFCLK rms phase jitter requirement at reference clock frequencies other than 100 MHz, use the following formula:

$$\text{REFCLK rms phase jitter at } f \text{ (MHz)} = \text{REFCLK rms phase jitter at 100 MHz} * 100/f$$
- (4) The minimum reconfig_clk frequency is 2.5 MHz if the transceiver channel is configured in **Transmitter only** mode. The minimum reconfig_clk frequency is 37.5 MHz if the transceiver channel is configured in **Receiver only** or **Receiver and Transmitter** mode.
- (5) If your design uses more than one dynamic reconfiguration controller (`altgx_reconfig`) instances to control the transceiver (`altgx`) channels physically located on the same side of the device AND if you use different reconfig_clk sources for these `altgx_reconfig` instances, the delta time between any two of these reconfig_clk sources becoming stable must not exceed the maximum specification listed.
- (6) The device cannot tolerate prolonged operation at this absolute maximum.
- (7) You must use the 1.1-V RX V_{ICM} setting if the input serial data standard is LVDS.
- (8) The differential eye opening specification at the receiver input pins assumes that Receiver Equalization is disabled. If you enable Receiver Equalization, the receiver circuitry can tolerate a lower minimum eye opening, depending on the equalization level. Use H-Spice simulation to derive the minimum eye opening requirement with Receiver Equalization enabled.
- (9) The rate matcher supports only up to ± 300 ppm.
- (10) Time taken to rx_pll_locked goes high from rx_analogreset de-assertion. Refer to [Figure 1–1 on page 1–33](#).
- (11) Time for which the CDR must be kept in lock-to-reference mode after rx_pll_locked goes high and before rx_locktodata is asserted in manual mode. Refer to [Figure 1–1 on page 1–33](#).
- (12) Time taken to recover valid data after the rx_locktodata signal is asserted in manual mode. Refer to [Figure 1–1 on page 1–33](#).
- (13) Time taken to recover valid data after the rx_freqlocked signal goes high in automatic mode. Refer to [Figure 1–2 on page 1–33](#).
- (14) A GPLL may be required to meet the PMA-FPGA fabric interface timing above certain data rates. For more information, refer to the [Transceiver Clocking for Arria II Devices](#) chapter.
- (15) The Quartus II software automatically selects the appropriate slew rate depending on the configured data rate or functional mode.
- (16) To support data rates lower than the minimum specification through oversampling, use the CDR in LTR mode only.

Figure 1-1 shows the lock time parameters in manual mode.

 LTD = lock-to-data. LTR = lock-to-reference.

Table 1–38 lists the typical transmitter pre-emphasis levels in dB for the first post tap under the following conditions: low-frequency data pattern (five 1s and five 0s) at 6.375 Gbps. The levels listed in Table 1–38 are a representation of possible pre-emphasis levels under these specified conditions only; the pre-emphasis levels may change with data pattern and data rate.

To predict the pre-emphasis level for your specific data rate and pattern, run simulations using the Arria II GX HSSI HSPICE models.
