Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Notes to Table 1–6:

(1) Altera recommends a 3.0-V nominal battery voltage when connecting V_{CCBAT} to a battery for volatile key backup. If you do not use the volatile security key, you may connect the V_{CCBAT} to either GND or a 3.0-V power supply.

(2) V_{CCPD} must be 2.5 V when V_{CCIO} is 2.5, 1.8, 1.5, or 1.2 V. V_{CCPD} must be 3.0 V when V_{CCIO} is 3.0 V.

(3) n = 0, 1, or 2.

(4) $V_{CCA\_L/R}$ must be connected to a 3.0-V supply if the clock multiplier unit (CMU) phase-locked loop (PLL), receiver clock data recovery (CDR), or both, are configured at a base data rate > 4.25 Gbps. For data rates up to 4.25 Gbps, you can connect $V_{CCA\_L/R}$ to either 3.0 V or 2.5 V.

(5) $V_{CCH\_GXBL/R}$ must be connected to a 1.4-V supply if the transmitter channel data rate is > 6.5 Gbps. For data rates up to 6.5 Gbps, you can connect $V_{CCH\_GXBL/R}$ to either 1.4 V or 1.5 V.

(6) Transceiver power supplies do not have power-on-reset (POR) circuitry. After initial power-up, violating the transceiver power supply operating conditions could lead to unpredictable link behavior.

DC Characteristics

This section lists the supply current, I/O pin leakage current, on-chip termination (OCT) accuracy and variation, input pin capacitance, internal weak pull-up and pull-down resistance, hot socketing, and Schmitt trigger input specifications.

Supply Current

Standby current is the current the device draws after the device is configured with no inputs or outputs toggling and no activity in the device. Because these currents vary largely with the resources used, use the Microsoft Excel-based Early Power Estimator (EPE) to get supply current estimates for your design.

For more information about power estimation tools, refer to the *PowerPlay Early Power Estimator User Guide* and the *PowerPlay Power Analysis* chapter.

Use the following with Equation 1–1:

- R_{SCAL} is the OCT resistance value at power up.
- ΔT is the variation of temperature with respect to the temperature at power up.
- ΔV is the variation of voltage with respect to the V_{CCIO} at power up.
- dR/dT is the percentage change of R_{SCAL} with temperature.
- dR/dV is the percentage change of R_{SCAL} with voltage.

Table 1–14 lists the OCT variation with temperature and voltage after power-up calibration for Arria II GX devices.

Table 1–14. OCT Variation after Power-up Calibration for Arria II GX Devices

1.8	0.219	0.086
1.5	0.199	0.136
1.2	0.161	0.288

Table 1–15 lists the OCT variation with temperature and voltage after power-up calibration for Arria II GZ devices.

1.2	0.317	0.1241

Note to Table 1–15:

(1) Valid for V_{CCIO} range of ±5% and temperature range of 0° to 85°C.

Pin Capacitance

Table 1–16 lists the pin capacitance for Arria II GX devices.

Table 1–16. Pin Capacitance for Arria II GX Devices

Symbol	Description	Typical	Unit
C_{IO}	Input capacitance on I/O pins, dual-purpose pins (differential I/O, clock, R_{up}, R_{dn}), and dedicated clock input pins	7	pF

Table 1–19 lists the weak pull-up resistor values for Arria II GZ devices.

Table 1–19. Internal Weak Pull-Up Resistor for Arria II GZ Devices *(Note 1)*, *(2)*

Symbol	Description	Conditions	Min	Typ	Max	Unit
R_{PU}	Value of the I/O pin pull-up resistor before and during configuration, as well as user mode if the programmable pull-up resistor option is enabled.	V_{CCIO} = 3.0 V ±5% *(3)*	—	25	—	kΩ
		V_{CCIO} = 2.5 V ±5% *(3)*	—	25	—	kΩ
		V_{CCIO} = 1.8 V ±5% *(3)*	—	25	—	kΩ
		V_{CCIO} = 1.5 V ±5% *(3)*	—	25	—	kΩ
		V_{CCIO} = 1.2 V ±5% *(3)*	—	25	—	kΩ

Notes to Table 1–19:

(1) All I/O pins have an option to enable weak pull-up except configuration, test, and JTAG pins.

(2) The internal weak pull-down feature is only available for the JTAG `TCK` pin. The typical value for this internal weak pull-down resistor is approximately 25 kΩ .

(3) Pin pull-up resistance values may be lower if an external source drives the pin higher than V_{CCIO}.

Hot Socketing

Table 1–20 lists the hot-socketing specification for Arria II GX and GZ devices.

Table 1–20. Hot Socketing Specifications for Arria II Devices

Symbol	Description	Maximum
$I_{IIOPIN(DC)}$	DC current per I/O pin	300 μA
$I_{IOPIN(AC)}$	AC current per I/O pin	8 mA *(1)*
$I_{XCVRTX(DC)}$	DC current per transceiver TX pin	100 mA
$I_{XCVRRX(DC)}$	DC current per transceiver RX pin	50 mA

Note to Table 1–20:

(1) The I/O ramp rate is 10 ns or more. For ramp rates faster than 10 ns, $|I_{IOPIN}|$ = C dv/dt, in which “C” is I/O pin capacitance and “dv/dt” is slew rate.

Schmitt Trigger Input

The Arria II GX device supports Schmitt trigger input on the `TDI`, `TMS`, `TCK`, `nSTATUS`, `nCONFIG`, `nCE`, `CONF_DONE`, and `DCLK` pins. A Schmitt trigger feature introduces hysteresis to the input signal for improved noise immunity, especially for signals with slow edge rates.

Table 1–21 lists the hysteresis specifications across the supported V_{CCIO} range for Schmitt trigger inputs in Arria II GX devices.

Table 1–21. Schmitt Trigger Input Hysteresis Specifications for Arria II GX Devices

Notes to Table 1–53:

(1) $f_{HSCLK\_IN} = f_{HSDR}$ / W. Use W to determine the supported selection of input reference clock frequencies for the desired data rate.

(2) Applicable for interfacing with DPA receivers only. For interfacing with non-DPA receivers, you must calculate the leftover timing margin in the receiver by performing link timing closure analysis. For Arria II GX transmitter to Arria II GX non-DPA receiver, the maximum supported data rate is 945 Mbps. For data rates above 840 Mbps, perform PCB trace compensation by adjusting the PCB trace length for LVDS channels to improve channel-to-channel skews.

(3) The minimum and maximum specification depends on the clock source (for example, PLL and clock pin) and the clock routing resource you use (global, regional, or local). The I/O differential buffer and input register do not have a minimum toggle rate.

(4) The specification is only applicable under the influence of core noise.

(5) Applicable for true LVDS using dedicated SERDES only.

(6) Dedicated SERDES and DPA features are only available on the right banks.

(7) You must calculate the leftover timing margin in the receiver by performing link timing closure analysis. You must consider the board skew margin, transmitter channel-to-channel skew, and the receiver sampling margin to determine the leftover timing margin.

I/O Timing

Altera offers two ways to determine I/O timing:

- Using the Microsoft Excel-based I/O Timing.
- Using the Quartus II Timing Analyzer.

The Microsoft Excel-based I/O Timing provides pin timing performance for each device density and speed grade. The data is typically used prior to designing the FPGA to get an estimate of the timing budget as part of the link timing analysis. The Quartus II timing analyzer provides a more accurate and precise I/O timing data based on the specifics of the design after place-and-route is complete.

The Microsoft Excel-based I/O Timing spreadsheet is downloadable from the Literature: Arria II Devices web page.

Table 1–68. Glossary (Part 3 of 4)

Letter	Subject	Definitions
S	**SW (sampling window)**	The period of time during which the data must be valid in order to capture it correctly. The setup and hold times determine the ideal strobe position within the sampling window: *Timing Diagram* 	Single-ended Voltage Referenced I/O Standard	The JEDEC standard for SSTL and HSTL I/O standards define both the AC and DC input signal values. The AC values indicate the voltage levels at which the receiver must meet its timing specifications. The DC values indicate the voltage levels at which the final logic state of the receiver is unambiguously defined. After the receiver input has crossed the AC value, the receiver changes to the new logic state. The new logic state is then maintained as long as the input stays beyond the AC threshold. This approach is intended to provide predictable receiver timing in the presence of input waveform ringing: *Single-Ended Voltage Referenced I/O Standard* T	**t_C**	High-speed receiver and transmitter input and output clock period.
	TCCS (channel-to-channel-skew)	The timing difference between the fastest and slowest output edges, including t_{CO} variation and clock skew, across channels driven by the same PLL. The clock is included in the TCCS measurement (refer to the *Timing Diagram* figure under **S** in this table).
	t_{DUTY}	High-speed I/O block: Duty cycle on the high-speed transmitter output clock. **Timing Unit Interval (TUI)** The timing budget allowed for skew, propagation delays, and data sampling window. (TUI = 1/(Receiver Input Clock Frequency Multiplication Factor) = t_C/w)
	t_{FALL}	Signal high-to-low transition time (80-20%)
	t_{INCCJ}	Cycle-to-cycle jitter tolerance on the PLL clock input.
	t_{OUTPJ_IO}	Period jitter on the general purpose I/O driven by a PLL.
	t_{OUTPJ_DC}	Period jitter on the dedicated clock output driven by a PLL.
	t_{RISE}	Signal low-to-high transition time (20-80%).
