Understanding **Embedded - FPGAs (Field Programmable Gate Array)**

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Hot Socketing

Table 1-20 lists the hot-socketing specification for Arria II GX and GZ devices.

Table 1-20. Hot Socketing Specifications for Arria II Devices

Note to Table 1-20:

- The I/O ramp rate is 10 ns or more. For ramp rates faster than 10 ns, |I_{IOPIN}| = C dv/dt, in which “C” is I/O pin capacitance and “dv/dt” is slew rate.

Schmitt Trigger Input

Notes to Table 1-45:

- (1) This specification is limited in the Quartus II software by the I/O maximum frequency. The maximum I/O frequency is different for each I/O standard.
- (2) This specification is limited by the lower of the two: I/O F_{MAX} or F_{OUT} of the PLL.
- (3) A high input jitter directly affects the PLL output jitter. To have low PLL output clock jitter, you must provide a clean clock source that is less than 120 ps.
- (4) F_{REF} is f_{IN}/N when $N = 1$.
- (5) Peak-to-peak jitter with a probability level of 10^{-12} (14 sigma, 99.9999999974404% confidence level). The output jitter specification applies to the intrinsic jitter of the PLL, when an input jitter of 30 ps is applied. The external memory interface clock output jitter specifications use a different measurement method and are available in [Table 1-64 on page 1-71](#).
- (6) The cascaded PLL specification is only applicable with the following condition:
 - a. Upstream PLL: $0.59 \text{ Mhz} \leq \text{Upstream PLL BW} < 1 \text{ MHz}$
 - b. Downstream PLL: $\text{Downstream PLL BW} > 2 \text{ MHz}$
- (7) High bandwidth PLL settings are not supported in external feedback mode.
- (8) External memory interface clock output jitter specifications use a different measurement method, which is available in [Table 1-63 on page 1-71](#).

Periphery Performance

This section describes periphery performance, including high-speed I/O, external memory interface, and IOE programmable delay.

I/O performance supports several system interfaces, for example the high-speed I/O interface, external memory interface, and the PCI/PCI-X bus interface. I/O using SSTL-18 Class I termination standard can achieve up to the stated DDR2 SDRAM interfacing speed with typical DDR2 SDRAM memory interface setup. I/O using general purpose I/O (GPIO) standards such as 3.0, 2.5, 1.8, or 1.5 LVTTTL/LVCMOS are capable of typical 200 MHz interfacing frequency with 10pF load.

Actual achievable frequency depends on design- and system-specific factors. You should perform HSPICE/IBIS simulations based on your specific design and system setup to determine the maximum achievable frequency in your system.

I/O Timing

Altera offers two ways to determine I/O timing:

- Using the Microsoft Excel-based I/O Timing.
- Using the Quartus II Timing Analyzer.

The Microsoft Excel-based I/O Timing provides pin timing performance for each device density and speed grade. The data is typically used prior to designing the FPGA to get an estimate of the timing budget as part of the link timing analysis. The Quartus II timing analyzer provides a more accurate and precise I/O timing data based on the specifics of the design after place-and-route is complete.

The Microsoft Excel-based I/O Timing spreadsheet is downloadable from the [Literature: Arria II Devices](#) web page.
