Understanding [Embedded - FPGAs \(Field Programmable Gate Array\)](#)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Power Consumption for the Arria II Device Family

Altera offers two ways to estimate power for a design:

- Using the Microsoft Excel-based Early Power Estimator
- Using the Quartus® II PowerPlay Power Analyzer feature

The interactive Microsoft Excel-based Early Power Estimator is typically used prior to designing the FPGA in order to get a magnitude estimate of the device power. The Quartus II PowerPlay Power Analyzer provides better quality estimates based on the specifics of the design after place-and-route is complete. The PowerPlay Power Analyzer can apply a combination of user-entered, simulation-derived, and estimated signal activities which, when combined with detailed circuit models, can yield very accurate power estimates.

For more information about power estimation tools, refer to the *PowerPlay Early Power Estimator User Guide* and the *PowerPlay Power Analysis* chapter in volume 3 of the *Quartus II Handbook*.

Notes to Table 1-45:

- (1) This specification is limited in the Quartus II software by the I/O maximum frequency. The maximum I/O frequency is different for each I/O standard.
- (2) This specification is limited by the lower of the two: I/O F_{MAX} or F_{OUT} of the PLL.
- (3) A high input jitter directly affects the PLL output jitter. To have low PLL output clock jitter, you must provide a clean clock source that is less than 120 ps.
- (4) F_{REF} is f_{IN}/N when $N = 1$.
- (5) Peak-to-peak jitter with a probability level of 10^{-12} (14 sigma, 99.9999999974404% confidence level). The output jitter specification applies to the intrinsic jitter of the PLL, when an input jitter of 30 ps is applied. The external memory interface clock output jitter specifications use a different measurement method and are available in Table 1-64 on page 1-71.
- (6) The cascaded PLL specification is only applicable with the following condition:
 - a. Upstream PLL: $0.59 \text{ MHz} \leq \text{Upstream PLL BW} < 1 \text{ MHz}$
 - b. Downstream PLL: $\text{Downstream PLL BW} > 2 \text{ MHz}$
- (7) High bandwidth PLL settings are not supported in external feedback mode.
- (8) External memory interface clock output jitter specifications use a different measurement method, which is available in Table 1-63 on page 1-71.

Notes to Table 1–54:

- (1) When J = 3 to 10, use the SERDES block.
- (2) When J = 1 or 2, bypass the SERDES block.
- (3) Clock Boost Factor (W) is the ratio between input data rate to the input clock rate.
- (4) The minimum specification depends on the clock source (for example, the PLL and clock pin) and the clock routing resource (global, regional, or local) that you use. The I/O differential buffer and input register do not have a minimum toggle rate.
- (5) You must calculate the leftover timing margin in the receiver by performing link timing closure analysis. You must consider the board skew margin, transmitter channel-to-channel skew, and receiver sampling margin to determine leftover timing margin.
- (6) You can estimate the achievable maximum data rate for non-DPA mode by performing link timing closure analysis. You must consider the board skew margin, transmitter delay margin, and the receiver sampling margin to determine the maximum data rate supported.
- (7) This is achieved by using the LVDS and DPA clock network.
- (8) If the receiver with DPA enabled and transmitter are using shared PLLs, the minimum data rate is 150 Mbps.
- (9) This only applies to DPA and soft-CDR modes.
- (10) This only applies to LVDS source synchronous mode.

I/O Timing

Altera offers two ways to determine I/O timing:

- Using the Microsoft Excel-based I/O Timing.
- Using the Quartus II Timing Analyzer.

The Microsoft Excel-based I/O Timing provides pin timing performance for each device density and speed grade. The data is typically used prior to designing the FPGA to get an estimate of the timing budget as part of the link timing analysis. The Quartus II timing analyzer provides a more accurate and precise I/O timing data based on the specifics of the design after place-and-route is complete.

The Microsoft Excel-based I/O Timing spreadsheet is downloadable from the [Literature: Arria II Devices](#) web page.
