Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

Table 1–39 lists typical transmitter pre-emphasis levels for Arria II GZ devices (in dB) for the first post tap under the following conditions (low-frequency data pattern [five 1s and five 0s] at 6.25 Gbps). The levels listed in **Table 1–39** are a representation of possible pre-emphasis levels under the specified conditions only and that the pre-emphasis levels may change with data pattern and data rate.

 To predict the pre-emphasis level for your specific data rate and pattern, run simulations using the [Arria II HSSI HSPICE](#) models.

$t_{CASC_OUTJITTER_PERIOD_DEDCLK}$ (6), (7)	Period Jitter for dedicated clock output in cascaded PLLs ($f_{OUT} \geq 100$ MHz)	—	—	425	ps (p-p)
	Period Jitter for dedicated clock output in cascaded PLLs ($f_{OUT} \leq 100$ MHz)	—	—	42.5	mUI (p-p)

Notes to Table 1–44:

- (1) f_{IN} is limited by the I/O f_{MAX} .
- (2) The VCO frequency reported by the Quartus II software in the PLL summary section of the compilation report takes into consideration the VCO post-scale counter K value. Therefore, if the counter K has a value of 2, the frequency reported can be lower than the f_{VCO} specification.
- (3) A high-input jitter directly affects the PLL output jitter. To have low PLL output clock jitter, you must provide a clean-clock source, which is less than 200 ps.
- (4) F_{REF} is f_{IN}/N when $N = 1$.
- (5) This specification is limited by the lower of the two: I/O f_{MAX} or f_{OUT} of the PLL.
- (6) Peak-to-peak jitter with a probability level of 10^{-12} (14 sigma, 99.999999974404% confidence level). The output jitter specification applies to the intrinsic jitter of the PLL, when an input jitter of 30 ps is applied. The external memory interface clock output jitter specifications use a different measurement method and are available in [Table 1–62 on page 1–70](#).
- (7) The cascaded PLL specification is only applicable with the following condition:
 - a. Upstream PLL: 0.59 MHz \leq Upstream PLL BW < 1 MHz
 - b. Downstream PLL: Downstream PLL BW > 2 MHz

[Table 1–45](#) lists the PLL specifications for Arria II GZ devices when operating in both the commercial junction temperature range (0° to 85°C) and the industrial junction temperature range (-40° to 100°C).
