Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Obsolete
Core Processor	Z8
Core Size	8-Bit
Speed	10MHz
Connectivity	-
Peripherals	Brown-out Detect/Reset, POR, PWM, WDT
Number of I/O	14
Program Memory Size	1KB (1K x 8)
Program Memory Type	OTP
EEPROM Size	-
RAM Size	64 x 8
Voltage - Supply (Vcc/Vdd)	3V ~ 5.5V
Data Converters	-
Oscillator Type	Internal
Operating Temperature	0°C ~ 70°C (TA)
Mounting Type	Surface Mount
Package / Case	20-SSOP (0.209", 5.30mm Width)
Supplier Device Package	-
Purchase URL	https://www.e-xfl.com/product-detail/zilog/z8pe003hz010sc00tr

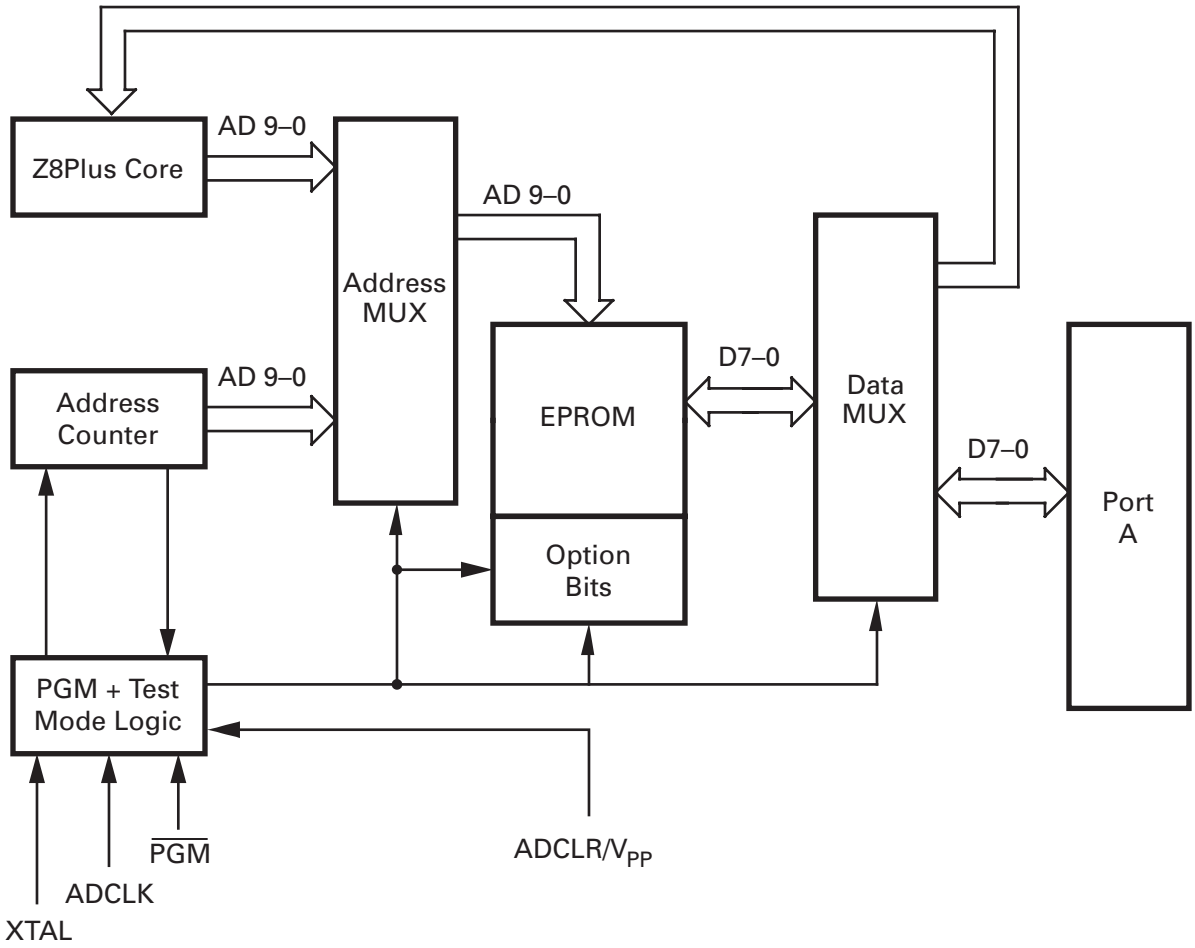

Figure 2. EPROM Programming Mode Block Diagram

DC ELECTRICAL CHARACTERISTICS

Table 5. DC Electrical Characteristics

			T_A = 0ºC to +70ºC Standard Temperatures					
Sym	**Parameter**	**V_{CC}[1]**	**Min**	**Max**	**Typical[2] @ 25°C**	**Units**	**Conditions**	**Notes**
V_{CH}	Clock Input High Voltage	3.0V	$0.7V_{CC}$	V_{CC}+0.3	1.3	V	Driven by External Clock Generator	
		5.5V	$0.7V_{CC}$	V_{CC}+0.3	2.5	V	Driven by External Clock Generator	
V_{CL}	Clock Input Low Voltage	3.0V	V_{SS}–0.3	$0.2V_{CC}$	0.7	V	Driven by External Clock Generator	
		5.5V	V_{SS}–0.3	$0.2V_{CC}$	1.5	V	Driven by External Clock Generator	
V_{IH}	Input High Voltage	3.0V	$0.7V_{CC}$	V_{CC}+0.3	1.3	V		
		5.5V	$0.7V_{CC}$	V_{CC}+0.3	2.5	V		
V_{IL}	Input Low Voltage	3.0V	V_{SS}–0.3	$0.2V_{CC}$	0.7	V		
		5.5V	V_{SS}–0.3	$0.2V_{CC}$	1.5	V		
V_{OH}	Output High Voltage	3.0V	V_{CC}–0.4		3.1	V	I_{OH} = –2.0 mA	
		5.5V	V_{CC}–0.4		4.8	V	I_{OH} = –2.0 mA	
V_{OL1}	Output Low Voltage	3.0V		0.6	0.2	V	I_{OL} = +4.0 mA	
		5.5V		0.4	0.1	V	I_{OL} = +4.0 mA	
V_{OL2}	Output Low Voltage	3.0V		1.2	0.5	V	I_{OL} = +6 mA	
		5.5V		1.2	0.5	V	I_{OL} = +12 mA	
V_{OFFSET}	Comparator Input Offset Voltage	3.0V		25.0	10.0	mV		
		5.5V		25.0	10.0	mV		
I_{IL}	Input Leakage	3.0V	–1.0	2.0	0.064	µA	V_{IN} = 0V, V_{CC}	
		5.5V	–1.0	2.0	0.064	µA	V_{IN} = 0V, V_{CC}	
I_{OL}	Output Leakage	3.0V	–1.0	2.0	0.114	µA	V_{IN} = 0V, V_{CC}	
		5.5V	–1.0	2.0	0.114	µA	V_{IN} = 0V, V_{CC}	
V_{ICR}	Comparator Input Common Mode Voltage Range	3.0V	V_{SS}–0.3	V_{CC}–1.0		V		3
		5.5V	V_{SS}–0.3	V_{CC}–1.0		V		3
R_{PB5}	PB5 Pull-up Resistor	3.0V	100		200	kOhm		4
		5.5V	100		200			
V_{LV}	V_{CC} Low-Voltage Protection		2.45	2.85	2.60	V		

Notes:

1. The V_{CC} voltage specification of 3.0V guarantees 3.0V; the V_{CC} voltage specification of 5.5V guarantees 5.0V ±0.5V.
2. Typical values are measured at V_{CC} = 3.3V and V_{CC} = 5.0V; V_{SS} = 0V = GND.
3. For the analog comparator input when the analog comparator is enabled.
4. No protection diode is provided from the pin to V_{CC}. External protection is recommended.
5. All outputs are unloaded and all inputs are at the V_{CC} or V_{SS} level.
6. CL1 = CL2 = 22 pF.
7. Same as note 5, except inputs are at V_{CC}.

AC ELECTRICAL CHARACTERISTICS

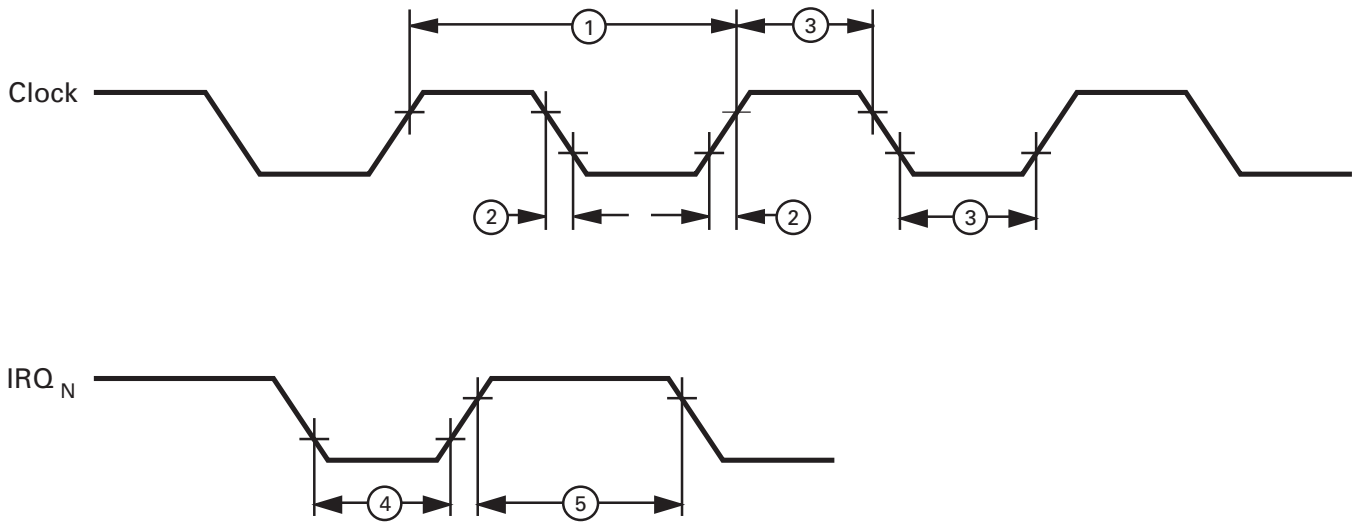

Figure 8. AC Electrical Timing Diagram

Table 7. Additional Timing

				T_A = 0°C to +70°C T_A = –40°C to +105°C @ 10 MHz			
No	**Symbol**	**Parameter**	**V_{CC}[1]**	**Min**	**Max**	**Units**	**Notes**
1	T_PC	Input Clock Period	3.0V	100	DC	ns	2
			5.5V	100	DC	ns	2
2	T_RC,T_FC	Clock Input Rise and Fall Times	3.0V		15	ns	2
			5.5V		15	ns	2
3	T_WC	Input Clock Width	3.0V	50		ns	2
			5.5V	50		ns	2
4	T_WIL	Int. Request Input Low Time	3.0V	70		ns	2
			5.5V	70		ns	2
5	T_WIH	Int. Request Input High Time	3.0V	5TpC			2
			5.5V	5TpC			2
6	T_{WSM}	STOP mode Recovery Width Spec.	3.0V	25		ns	
			5.5V	25		ns	
7	T_{OST}	Oscillator Start-Up Time	3.0V		5TpC		
			5.5V		5TpC		
8	T_{POR}	Power-On Reset Time	3.0V	128 T_PC + T_{OST}			
			5.5V				

Notes:
1. The V_{DD} voltage specification of 3.0V guarantees 3.0V. The V_{DD} voltage specification of 5.5V guarantees 5.0V ±0.5V.
2. Timing Reference uses 0.7 V_{CC} for a logical 1 and 0.2 V_{CC} for a logical 0.

Z8PLUS CORE

The device is based on the ZiLOG Z8Plus Core Architecture. This core is capable of addressing up to 64KB of program memory and 4 KB of RAM. Register RAM is accessed as either 8- or 16-bit registers using a combination of 4-, 8-, and 12-bit addressing modes. The architecture supports up to 15 vectored interrupts from external and internal sources. The processor decodes 44 CISC instructions using 6 addressing modes. See the Z8Plus User's Manual for more information.

RESET

This section describes the Z8Plus reset conditions, reset timing, and register initialization procedures. Reset is generated by the Voltage Brown-Out/Power-On Reset (VBO/POR), Watch-Dog Timer (WDT), and Stop-Mode Recovery (SMR).

A system reset overrides all other operating conditions and puts the Z8Plus device into a known state. To initialize the chip's internal logic, the POR device counts 64 internal clock cycles after the oscillator stabilizes. The control registers and ports are not reset to their default conditions after wakeup from a STOP mode or WDT time-out.

During $\overline{\text{RESET}}$, the value of the program counter is 0020H. The I/O ports and control registers are configured to their default reset state. Resetting the device does not affect the contents of the general-purpose registers.

The $\overline{\text{RESET}}$ circuit initializes the control and peripheral registers, as shown in Table 8. Specific reset values are indicated by a 1 or a 0, while bits whose states are unchanged or unknown from Power-Up are indicated by the letter U.

Program execution starts 10 External Crystal (XTAL) clock cycles after the POR delay. The initial instruction fetch is from location 0020H. Figure 9 indicates reset timing.

After a reset, the first routine executed must be one that initializes the TCTLHI control register to the required system configuration This activity is followed by initialization of the remaining control registers.

Table 8. Control and Peripheral Registers*

		Bits								
Register (HEX)	**Register Name**	**7**	**6**	**5**	**4**	**3**	**2**	**1**	**0**	**Comments**
FF	Stack Pointer	0	0	U	U	U	U	U	U	Stack pointer is not affected by $\overline{\text{RESET}}$.
FE	Reserved									
FD	Register Pointer	U	U	U	U	0	0	0	0	Register pointer is not affected by $\overline{\text{RESET}}$.
FC	Flags	U	U	U	U	U	U	*	*	Only WDT & SMR flags are affected by $\overline{\text{RESET}}$.
FB	Interrupt Mask	0	0	0	0	0	0	0	0	All interrupts masked by $\overline{\text{RESET}}$.
FA	Interrupt Request	0	0	0	0	0	0	0	0	All interrupt requests cleared by $\overline{\text{RESET}}$.
F9–F0	Reserved									
EF–E0	Virtual Copy									Virtual copy of the current working register set.
DF–D8	Reserved									
D7	Port B Special Function	0	0	0	0	0	0	0	0	Deactivates all port special functions after $\overline{\text{RESET}}$.
D6	Port B Directional Control	0	0	0	0	0	0	0	0	Defines all bits as inputs in PortB after $\overline{\text{RESET}}$.
D5	Port B Output	U	U	U	U	U	U	U	U	Output register not affected by $\overline{\text{RESET}}$.

Note: *The SMR and WDT flags are set to indicate the source of the $\overline{\text{RESET}}$.

INTERRUPT SOURCES

Table 10 presents the interrupt types, sources, and vectors available in the Z8Plus. Other processors from the Z8Plus family may define the interrupts differently.

Table 10. Interrupt Types, Sources, and Vectors

Name	Sources	Vector Location	Comments	Fixed Priority
$IREQ_0$	Timer0 Time-out	2,3	Internal	1 (Highest)
$IREQ_1$	PB4 High-to-Low Transition	4,5	External (PB4), Edge Triggered	2
$IREQ_2$	Timer1 Time-out	6,7	Internal	3
$IREQ_3$	PB2 High-to-Low Transition	8,9	External (PB2), Edge Triggered	4
$IREQ_4$	PB4 Low-to-High Transition	A,B	External (PB4), Edge Triggered	5
$IREQ_5$	Timer2 Time-out	C,D	Internal	6 (Lowest)
$IREQ_6$–$IREQ_{15}$	Reserved		Reserved for future expansion	

External Interrupt Sources

External sources can be generated by a transition on the corresponding Port pin. The interrupt may detect a rising edge, a falling edge, or both.

Notes: The interrupt sources and trigger conditions are device dependent. See the device product specification to determine available sources (internal and external), triggering edge options, and exact programming details.

Although interrupts are edge triggered, minimum interrupt request Low and High times must be observed for proper operation. See the device product specification for exact timing requirements on external interrupt requests (T_WIL, T_WIH).

Internal Interrupt Sources

Internal interrupt sources and trigger conditions are device dependent. On-chip peripherals may set interrupt under various conditions. Some peripherals always set their corresponding IREQ bit while others must be specifically configured to do so.

See the device product specification to determine available sources, triggering edge options, and exact programming details. For more details on the interrupt sources, refer to the chapters describing the timers, comparators, I/O ports, and other peripherals.

Interrupt Mask Register (IMASK) Initialization

The IMASK register individually or globally enables or disables the interrupts (Table 11). When bits `0` through `5` are set to `1`, the corresponding interrupt requests are enabled. Bit `7` is the master enable bit and must be set before any of the individual interrupt requests can be recognized. Resetting bit `7` disables all the interrupt requests. Bit `7` is set and reset by the EI and DI instructions. It is automatically set to `0` during an interrupt service routine and set to `1` following the execution of an Interrupt Return (IRET) instruction. The IMASK registers are `reset` to `00h`, disabling all interrupts.

Notes: It is not good programming practice to directly assign a value to the master enable bit. A value change should always be accomplished by issuing the EI and DI instructions.

Care should be taken not to set or clear IMASK bits while the master enable is set.

Table 11. Interrupt Mask Register—IMASK (FBh)

Bit	7	6	5	4	3	2	1	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
R = Read W = Write X = Indeterminate U = Undefined/ Undetermined								

Bit Position	R/W	Value	Description
7		0 1	Disables Interrupts Enables Interrupts
6		0	Reserved, must be 0
5		0 1	Disables IRQ5 Enables IRQ5
4		0 1	Disables IRQ4 Enables IRQ4
3		0 1	Disables IRQ3 Enables IRQ3
2		0 1	Disables IRQ2 Enables IRQ2
1		0 1	Disables IRQ1 Enables IRQ1
0		0 1	Disables IRQ0 Enables IRQ0

Interrupt Request (IREQ) Register Initialization

IREQ (Table 12) is a register that stores the interrupt requests for both vectored and polled interrupts. When an interrupt is issued, the corresponding bit position in the register is set to 1. Bits 0 to 5 are assigned to interrupt requests IREQ0 to IREQ5, respectively.

Whenever RESET is executed, the IREQ resistor is set to 00h.

Table 12. Interrupt Request Register–IREQ (FAh)

Bit	7	6	5	4	3	2	1	0
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Reset	0	0	0	0	0	0	0	0
R = Read W = Write X = Indeterminate U = Undefined/ Undetermined								

Bit Position	R/W	Value	Description
7	R/W	0	Reserved, must be 0
6	R/W	0	Reserved, must be 0
5	R/W	0 1	IRQ5 reset IRQ5 set
4	R/W	0 1	IRQ4 reset IRQ4 set
3	R/W	0 1	IRQ3 reset IRQ3 set
2	R/W	0 1	IRQ2 reset IRQ2 set
1	R/W	0 1	IRQ1 reset IRQ1 set
0	R/W	0 1	IRQ0 reset IRQ0 set

STOP MODE OPERATION

The STOP mode provides the lowest possible device stand-by current. This instruction turns off the on-chip oscillator and internal system clock.

To enter the STOP mode, the Z8Plus only requires a STOP instruction. It is *not* necessary to execute a NOP instruction immediately before the STOP instruction.

```
6F   STOP   ;enter STOP mode
```

The STOP mode is exited by any one of the following resets: POR or a Stop-Mode Recovery source. At reset generation, the processor always restarts the application program at address 0020H, and the STOP mode flag is set. Reading the STOP mode flag does not clear it. The user must clear the STOP mode flag with software.

Note: Failure to clear the STOP mode flag can result in undefined behavior.

The Z8Plus provides a dedicated Stop-Mode Recovery (SMR) circuit. In this case, a low-level applied to input pin PB0 (I/O Port B, bit 0) triggers an SMR. To use this mode, pin PB0 must be configured as an input and the special function selected before the STOP mode is entered. The Low level on PB0 must be held for a minimum pulse width T_{WSM}. Program execution starts at address 20h, after the POR delay.

Notes: 1. The PB0 input, when used for Stop-Mode Recovery, does not initialize the control registers.

The STOP mode current (I_{CC2}) is minimized when:

- V_{CC} is at the low end of the device's operating range
- Output current sourcing is minimized
- All inputs (digital and analog) are at the Low or High rail voltages

2. For detailed information about flag settings, see the Z8Plus User's Manual.

OSCILLATOR OPERATION

The Z8Plus MCU uses a Pierce oscillator with an internal feedback resistor (Figure 14). The advantages of this circuit are low-cost, large output signal, low-power level in the crystal, stability with respect to V_{CC} and temperature, and low impedances (not disturbed by stray effects).

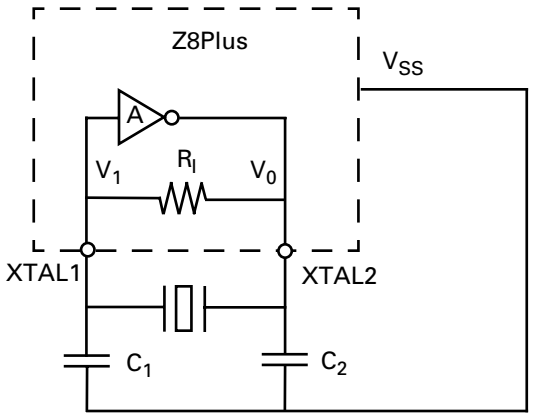

Figure 14. Pierce Oscillator with Internal Feedback Circuit

One drawback to the Pierce oscillator is the requirement for high gain in the amplifier to compensate for feedback path losses. The oscillator amplifies its own noise at start-up until it settles at the frequency that satisfies the gain/phase requirements. A x B = 1; where A = VO/VI is the gain of the amplifier, and B = VI/VO is the gain of the feedback element. The total phase shift around the loop is forced to 0 (360 degrees). V_{IN} must be in phase with itself; therefore, the amplifier/inverter provides a 180-degree phase shift, and the feedback element is forced to provide the other 180-degree phase shift.

R1 is a resistive component placed from output to input of the amplifier. The purpose of this feedback is to bias the amplifier in its linear region and provide the start-up transition.

Capacitor C2, combined with the amplifier output resistance, provides a small phase shift. It also provides some attenuation of overtones.

Capacitor C_1, combined with the crystal resistance, provides an additional phase shift.

Start-up time may be affected if C_1 and C_2 are increased dramatically in size. As C_1 and C_2 increase, the start-up time increases until the oscillator reaches a point where it ceases to operate.

For fast and reliable oscillator start-up over the manufacturing process range, the load capacitors should be sized as low as possible without resulting in overtone operation.

Layout

Traces connecting crystal, caps, and the Z8Plus oscillator pins should be as short and wide as possible to reduce parasitic inductance and resistance. The components (caps, the crystal, and resistors) should be placed as close as possible to the oscillator pins of the Z8Plus.

The traces from the oscillator pins of the integrated circuit (IC) and the ground side of the lead caps should be guarded from all other traces (clock, V_{CC}, address/data lines, and system ground) to reduce cross talk and noise injection. Guarding is usually accomplished by keeping other traces and system ground trace planes away from the oscillator circuit, and by placing a Z8Plus device V_{SS} ground ring around the traces/components. The ground side of the oscillator lead caps should be connected to a single trace to the Z8Plus device V_{SS} (GND) pin. It should not be shared with any other system-ground trace or components except at the Z8Plus device V_{SS} pin. The objective is to prevent differential system ground noise injection into the oscillator (Figure 15).

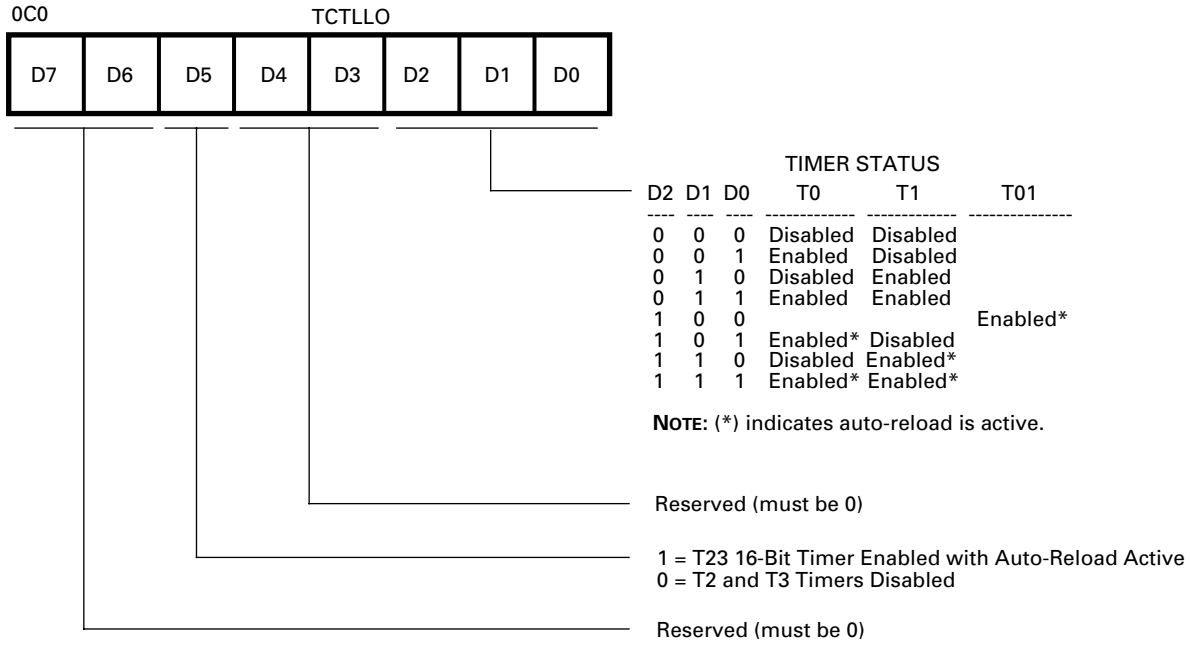
Indications of an Unreliable Design

There are two major indicators that are used in working designs to determine their reliability over full lot and temperature variations. They are:

Start-Up Time. If start-up time is excessive, or varies widely from unit to unit, there is probably a gain problem. To fix the problem, the C_1 and C_2 capacitors require reduction. The amplifier gain is either not adequate at frequency, or the crystal R's are too large.

Output Level. The signal at the amplifier output should swing from ground to V_{CC} to indicate adequate gain in the amplifier. As the oscillator starts up, the signal amplitude grows until clipping occurs. At that point, the loop gain is effectively reduced to unity, and constant oscillation is achieved. A signal of less than 2.5 volts peak-to-peak is an indication that low gain can be a problem. Either C_1 or C_2 should be made smaller, or a low-resistance crystal should be used.

TIMERS (Continued)



Note: Timer T01 is a 16-bit PWM Timer formed by cascading 8-bit timers T1 (MSB) and T0 (LSB). T23 is a standard 16-bit timer formed by cascading 8-bit timers T3 (MSB) and T2 (LSB).

Figure 22. TCTLLO Register

A pair of READ/WRITE registers is utilized for each 8-bit timer. One register is defined to contain the auto-initialization value for the timer. The second register contains the current value for the timer. When a timer is enabled, the timer decrements the value in its count register and continues decrementing until it reaches 0. An interrupt is generated, and the contents of the auto-initialization register are optionally copied into the count value register. If auto-initialization is not enabled, the timer stops counting when the value reaches 0. Control logic clears the appropriate control register bit to disable the timer. This operation is referred to as a *single-shot*. If auto-initialization is enabled, the timer counts from the initialization value. Software must not attempt to use timer registers for any other function.

User software is allowed to write to any WRITE register at any time; however, care should be taken if timer registers are updated while the timer is enabled. If software changes the count value while the timer is in operation, the timer continues counting from the updated value.

Note: Unpredictable behavior can occur if the value updates at the same time that the timer reaches 0.

Similarly, if user software changes the initialization value register while the timer is active, the next time that the timer reaches 0, the timer initializes to the changed value.

Note: Unpredictable behavior can occur if the initialization value register is changed while the timer is in the process of being initialized.

The initialization value is determined by the exact timing of the WRITE operation. In all cases, the Z8Plus assigns a higher priority to the software WRITE than to a decrementer write-back. However, when hardware clears a control register bit for a timer that is configured for single-shot operation, the clearing of the control bit overrides a software WRITE. A READ of either register can be conducted at any time, with no effect on the functionality of the timer.

TIMERS (Continued)

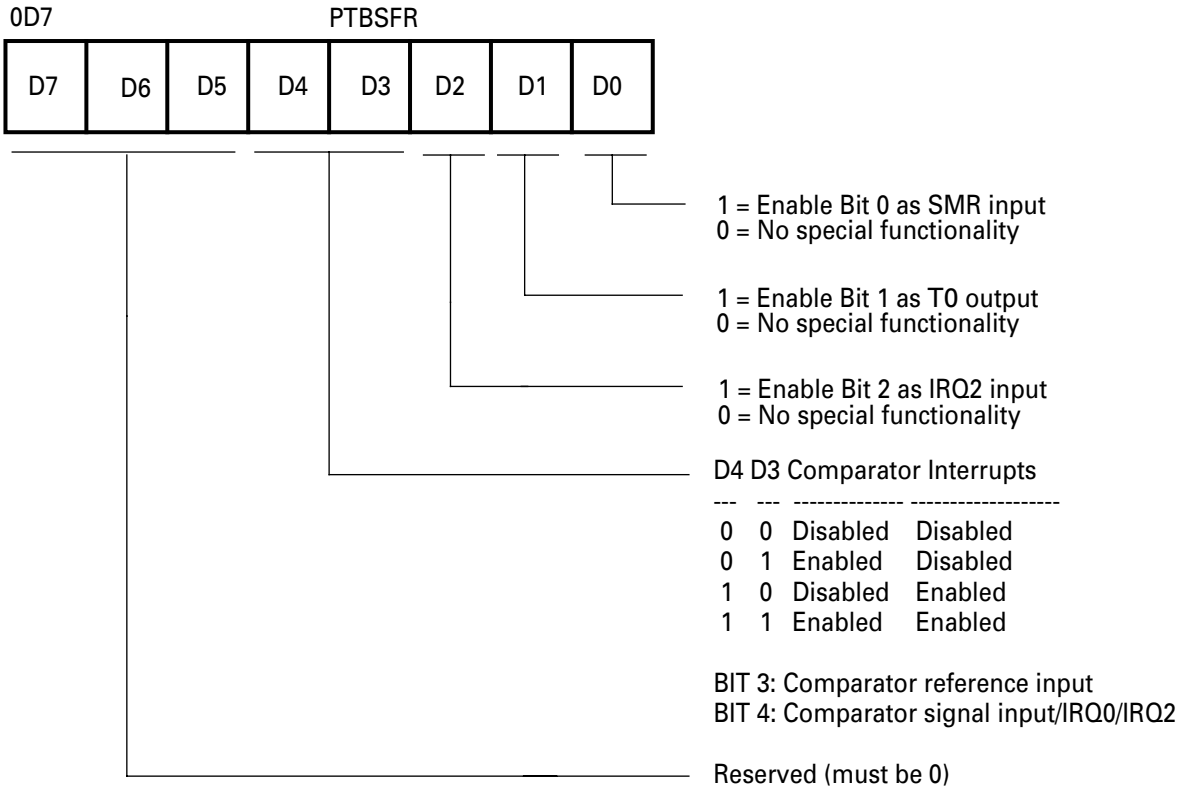


Figure 23. PortB Special Function Register

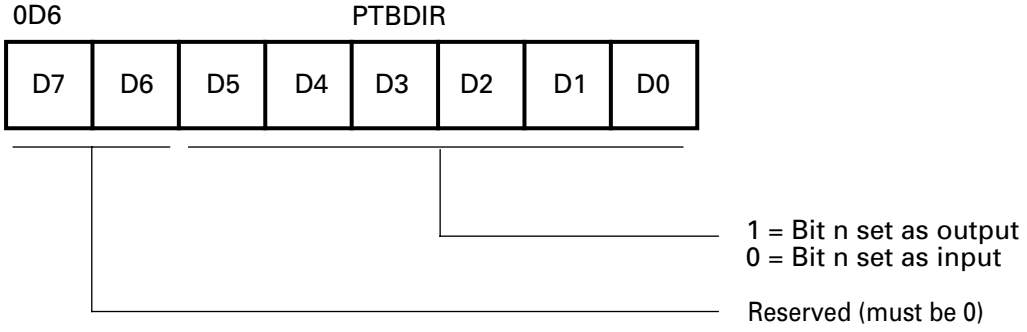

Figure 24. Port B Directional Control Register

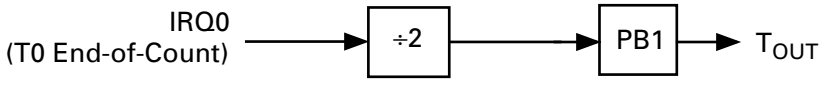

Figure 25. Timer T0 Output Through T_{OUT}

RESET CONDITIONS

After a $\overline{\text{RESET}}$, the timers are disabled. See Table 8 for timer control, value, and auto-initialization register status after $\overline{\text{RESET}}$.

I/O PORTS

The Z8Plus dedicates 14 lines to input and output. These lines are grouped into two ports known as Port A and Port B. Port A is an 8-bit port, bit programmable as either inputs or outputs. Port B can be programmed to provide either standard input/output, or the following special functions: T0 output, comparator input, SMR input, and external interrupt inputs.

All pins except PB5 include push-pull CMOS outputs. In addition, the outputs of Port A on a bit-wise basis can be configured for open-drain operation.The ports operate on a bit-wise basis. As such, the register values for/at a given bit position only affect the bit in question.

Each port is defined by a set of four control registers (Figure 26).

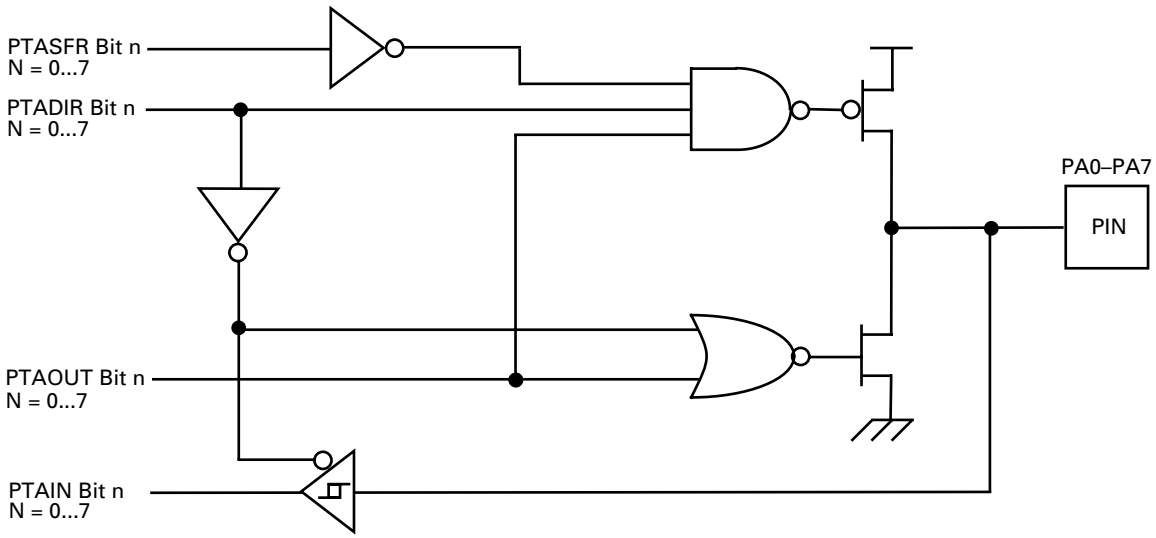

Figure 26. Port A Configuration with Open-Drain Capability and Schmitt-Trigger

Directional Control and Special Function Registers

Each port on the Z8Plus features a dedicated directional control register that determines (on a bit-wise basis) if a given port bit operates as input or output.

Each port on the Z8Plus features a special function register (SFR) that, in conjunction with the directional control register, implements (on a bit-by-bit basis) any special functionality that can be defined for each particular port bit.

Table 14. I/O Ports Registers

Register	Address	Identifier
Port B Special Function	0D7H	PTBSFR
Port B Directional Control	0D6H	PTBDIR
Port B Output Value	0D5H	PTBOUT
Port B Input Value	0D4H	PTBIN
Port A Special Function	0D3H	PTASFR
Port A Directional Control	0D2H	PTADIR
Port A Output Value	0D1H	PTAOUT
Port A Input Value	0D0H	PTAIN

Input and Output Value Registers

Each port features an Output Value Register and an input value register. For port bits configured as an input by means of the directional control register, the input value register

for that bit position contains the current synchronized input value.

For port bits configured as an output by means of the directional control register, the value held in the corresponding bit of the Output Value Register is driven directly onto the output pin. The opposite register bit for a given pin (the output register bit for an input pin and the input register bit for an output pin) holds their previous value. These bits are not changed and do not exhibit any effect on the hardware.

READ/WRITE OPERATIONS

The control for each port is done on a bit-by-bit basis. All bits are capable of operating as inputs or outputs, depending on the setting of the port's directional control register. If configured as an input, each bit is provided a Schmitt-trigger. The output of the Schmitt-trigger is latched twice to perform a synchronization function, and the output of the synchronizer is fed to the port input register, which can be read by software.

A WRITE to a port input register carries the effect of updating the contents of the input register, but subsequent READs do not necessarily return the same value that was written. If the bit in question is defined as an input, the input register for that bit position contains the current synchronized input value. WRITEs to that bit position are overwritten on the next clock cycle with the newly sampled input data. However, if the particular bit is programmed as an output, the input register for that bit retains the software-updated value. The port bits that are programmed as outputs do not sample the value being driven out.

Any bit in either port can be defined as an output by setting the appropriate bit in the directional control register. In this instance, the value held in the appropriate bit of the port output register is driven directly onto the output pin.

Note: The preceding result does not necessarily reflect the actual output value. If an external error is holding an output pin either High or Low against the output driver, the software READ returns the *requested* value, not the actual state caused by the contention. When a bit is defined as an output, the Schmitt-trigger on the input is disabled to save power.

Updates to the output register take effect based on the timing of the internal instruction pipeline; however, this timing is referenced to the rising edge of the clock. The output register can be read at any time, and returns the current output value that is held. No restrictions are placed on the timing of READs and/or WRITEs to any of the port registers with respect to the others.

Note: Care should be taken when updating the directional control and special function registers.

When updating a directional control register, the special function register (SFR) should first be disabled. If this precaution is not taken, unpredicted events could occur as a result of the change in the port I/O status. This precaution is especially important when defining changes in Port B, as the unpredicted event referred to above could be one or more interrupts. Clearing of the SFR register should be the first step in configuring the port, while setting the SFR register should be the final step in the port configuration process. To ensure unpredictable results, the SFR register should not be written until the pins are being driven appropriately, and all initialization is completed.

PORT A

Port A is a general-purpose port. Figure 27 features a block diagram of Port A. Each of its lines can be independently programmed as input or output via the Port A directional control register (PTADIR at 0D2H) as seen in Figure 26. A bit set to a 1 in PTADIR configures the corresponding bit in Port A as an output, while a bit cleared to 0 configures the corresponding bit in Port A as an input.

The input buffers are Schmitt-triggered. Bits programmed as outputs can be individually programmed as either push-pull or open-drain by setting the corresponding bit in the special function register (PTASFR, Figure 26).

PORT B CONTROL REGISTERS

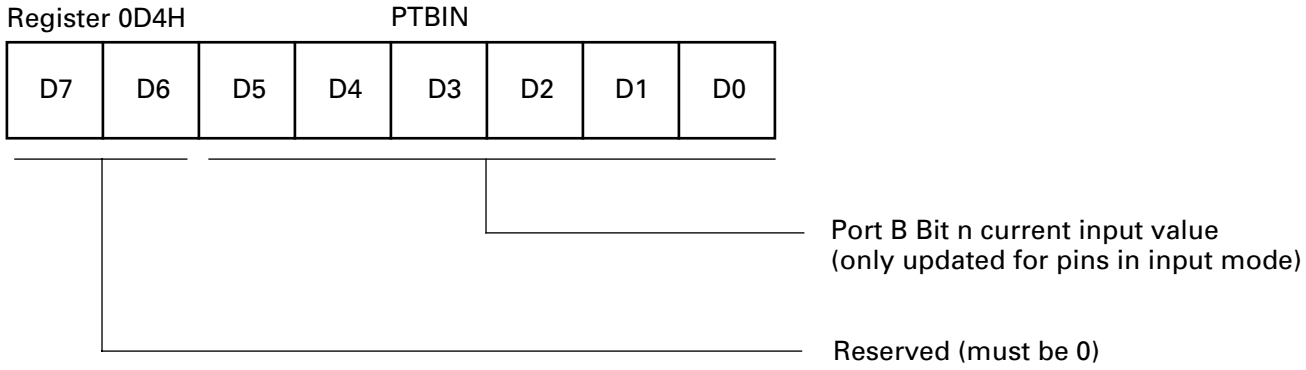

Figure 38. Port B Input Value Register

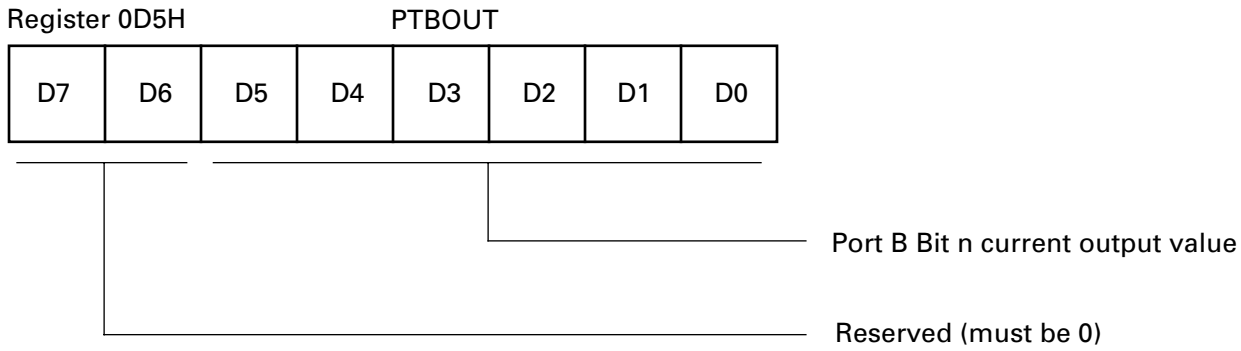

Figure 39. Port B Output Value Register

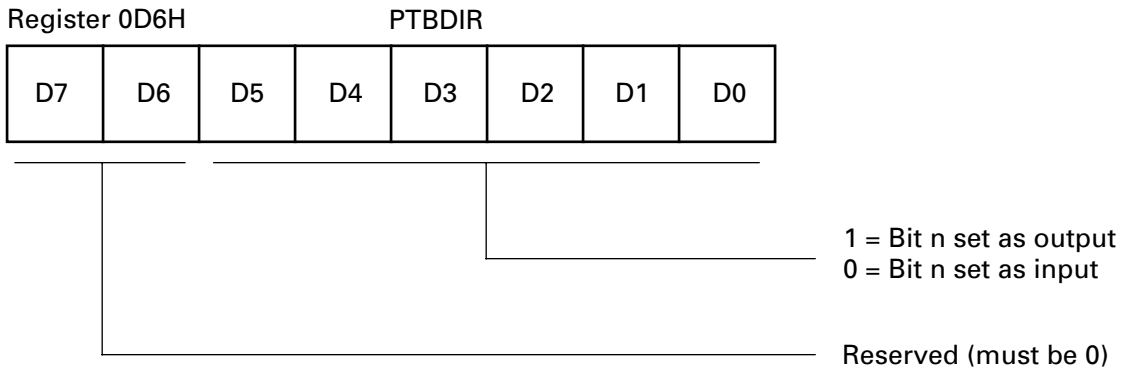

Figure 40. Port B Directional Control Register

I/O PORT RESET CONDITIONS

Full Reset

Port A and Port B output value registers are not affected by $\overline{\text{RESET}}$.

On $\overline{\text{RESET}}$, the Port A and Port B directional control registers are cleared to all zeros, which defines all pins in both ports as inputs.

On $\overline{\text{RESET}}$, the directional control registers redefine all pins as inputs, and the Port A and Port B input value registers overwrites the previously held data with the current sample of the input pins.

On $\overline{\text{RESET}}$, the Port A and Port B special function registers are cleared to 00h, which deactivates all port special functions.

Note: The SMR and WDT time-out events are *not* full device resets. The port control registers are not affected by either of these events.

ANALOG COMPARATOR

The device includes one on-chip analog comparator. Pin PB4 features a comparator front end. The comparator reference voltage is on pin PB3.

Comparator Description

The on-chip comparator can process an analog signal on PB4 with reference to the voltage on PB3. The analog function is enabled by programming the Port B special function register bits 3 and 4.

When the analog comparator function is enabled, bit 4 of the input register is defined as holding the synchronized output of the comparator, while bit 3 retains a synchronized sample of the reference input.

If the interrupts for PB4 are enabled when the comparator special function is selected, the output of the comparator generates interrupts.

COMPARATOR OPERATION

The comparator output reflects the relationship between the analog input to the reference input. If the voltage on the analog input is higher than the voltage on the reference input, then the comparator output is at a High state. If the voltage on the analog input is lower than the voltage on the reference input, then the analog output is at a Low state.

Comparator Definitions

V_{ICR}

The usable voltage range for the positive input and reference input is called the Comparator Input Common Mode Voltage Range (V_{ICR}).

Note: The comparator is not guaranteed to work if the input is outside of the V_{ICR} range.

V_{OFFSET}

The absolute value of the voltage between the positive input and the reference input required to make the comparator output voltage switch is the Comparator Input Offset Voltage (V_{OFFSET}).

I_{IO}

For the CMOS voltage comparator input, the input offset current (I_{IO}) is the leakage current of the CMOS input gate.

HALT Mode

The analog comparator is functional during HALT mode. If the interrupts are enabled, an interrupt generated by the comparator causes a return from HALT mode.

STOP Mode

The analog comparator is disabled during STOP mode. The comparator is powered down to prevent it from drawing any current.

Low Voltage Protection. An on-board Voltage Comparator checks that the V_{CC} is at the required level to ensure correct operation of the device. A reset is globally driven if V_{CC} is below the specified voltage (Low Voltage Protection).

The device functions normally at or above 3.0V under all conditions, and is guaranteed to function normally at supply voltages above the Low Voltage Protection trip point. Below 3.0V, the device functions normally until the Low Volt-

INPUT PROTECTION

All I/O pins feature diode input protection. There is a diode from the I/O pad to V_{CC} and V_{SS} (Figure 43).

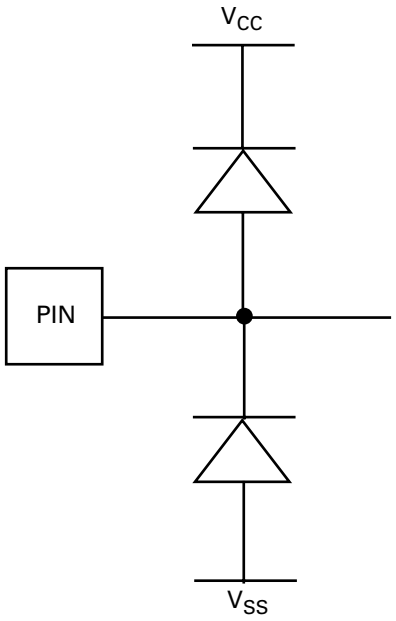

Figure 43. I/O Pin Diode Input Protection

However, the PB5 pin features only the input protection diode, from the pad to V_{SS} (Figure 44).

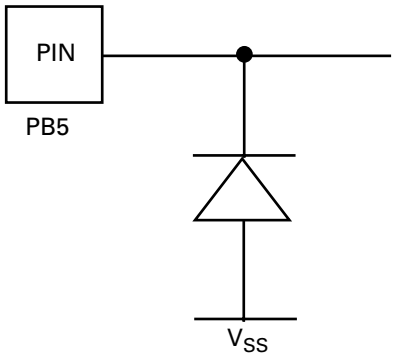

Figure 44. PB5 Pin Input Protection

The high-side input protection diode was removed on this pin to allow the application of high voltage during the OTP programming mode.

For better noise immunity in applications that are exposed to system EMI, a clamping diode to V_{SS} from this pin should be used to prevent entering the OTP programming mode or to prevent high voltage from damaging this pin.

ORDERING INFORMATION

Standard Temperature	
18-Pin DIP	Z8PE003PZ010SC
18-Pin SOIC	Z8PE003SZ010SC
20-Pin SSOP	Z8PE003HZ010SC
Extended Temperature	
18-Pin DIP	Z8PE003PZ010EC
18-Pin SOIC	Z8PE003SZ010EC
20-Pin SSOP	Z8PE003CZ010EC

For fast results, contact your local ZiLOG sales office for assistance in ordering the part(s) required.

Codes	
Preferred Package	PZ = Plastic DIP
Longer Lead Time	SZ = SOIC
	HZ = SSOP
Speed	010 = 10 MHz
Standard Temperature	S = 0°C to +70°C
Extended Temperature	E = –40°C to +105°C
Environmental Flow	C = Plastic Standard

Example:

The Z8PE003PZ010SC is a 10-MHz DIP, 0ºC to 70ºC, with Plastic Standard Flow.

Z	ZiLOG Prefix
8PE	Z8Plus Product
003	Product Number
PZ	Package Designation Code
010	Speed
SC	Temperature and Environmental Flow

Pre-Characterization Product:

The product represented by this document is newly introduced and ZiLOG has not completed the full characterization of the product. The document states what ZiLOG knows about this product at this time, but additional features or non-conformance with some aspects of the document may be found, either by ZiLOG or its customers in the course of further application and characterization work. In addition, ZiLOG cautions that delivery may be uncertain at times, due to start-up yield issues.
