### **Understanding Embedded - FPGAs (Field Programmable Gate Array)**

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

### **Applications of Embedded - FPGAs**

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

#### **Details**

Product Status	Obsolete
Number of LABs/CLBs	6144
Number of Logic Elements/Cells	27648
Total RAM Bits	393216
Number of I/O	660
Number of Gates	1569178
Voltage - Supply	1.71V ~ 1.89V
Mounting Type	Surface Mount
Operating Temperature	-40°C ~ 100°C (TJ)
Package / Case	1156-BBGA
Supplier Device Package	1156-FBGA (35x35)
Purchase URL	<a href="https://www.e-xfl.com/product-detail/xilinx/xcv1000e-6fg1156i">https://www.e-xfl.com/product-detail/xilinx/xcv1000e-6fg1156i</a>

## Development System

Virtex-E FPGAs are supported by the Xilinx Foundation and Alliance Series CAE tools. The basic methodology for Virtex-E design consists of three interrelated steps: design entry, implementation, and verification. Industry-standard tools are used for design entry and simulation (for example, Synopsys FPGA Express), while Xilinx provides proprietary architecture-specific tools for implementation.

The Xilinx development system is integrated under the Xilinx Design Manager (XDM™) software, providing designers with a common user interface regardless of their choice of entry and verification tools. The XDM software simplifies the selection of implementation options with pull-down menus and on-line help.

Application programs ranging from schematic capture to Placement and Routing (PAR) can be accessed through the XDM software. The program command sequence is generated prior to execution, and stored for documentation.

Several advanced software features facilitate Virtex-E design. RPMs, for example, are schematic-based macros with relative location constraints to guide their placement. They help ensure optimal implementation of common functions.

For HDL design entry, the Xilinx FPGA Foundation development system provides interfaces to the following synthesis design environments.

- Synopsys (FPGA Compiler, FPGA Express)
- Exemplar (Spectrum)
- Synplicity (Synplify)

For schematic design entry, the Xilinx FPGA Foundation and Alliance development system provides interfaces to the following schematic-capture design environments.

- Mentor Graphics V8 (Design Architect, QuickSim II)
- Viewlogic Systems (Viewdraw)

Third-party vendors support many other environments.

A standard interface-file specification, Electronic Design Interchange Format (EDIF), simplifies file transfers into and out of the development system.

Virtex-E FPGAs are supported by a unified library of standard functions. This library contains over 400 primitives and macros, ranging from 2-input AND gates to 16-bit accumulators, and includes arithmetic functions, comparators, counters, data registers, decoders, encoders, I/O functions, latches, Boolean functions, multiplexers, shift registers, and barrel shifters.

The “soft macro” portion of the library contains detailed descriptions of common logic functions, but does not contain any partitioning or placement information. The performance of these macros depends, therefore, on the partitioning and placement obtained during implementation.

RPMs, on the other hand, do contain predetermined partitioning and placement information that permits optimal

implementation of these functions. Users can create their own library of soft macros or RPMs based on the macros and primitives in the standard library.

The design environment supports hierarchical design entry, with high-level schematics that comprise major functional blocks, while lower-level schematics define the logic in these blocks. These hierarchical design elements are automatically combined by the implementation tools. Different design entry tools can be combined within a hierarchical design, thus allowing the most convenient entry method to be used for each portion of the design.

## Design Implementation

The place-and-route tools (PAR) automatically provide the implementation flow described in this section. The partitioner takes the EDIF net list for the design and maps the logic into the architectural resources of the FPGA (CLBs and IOBs, for example). The placer then determines the best locations for these blocks based on their interconnections and the desired performance. Finally, the router interconnects the blocks.

The PAR algorithms support fully automatic implementation of most designs. For demanding applications, however, the user can exercise various degrees of control over the process. User partitioning, placement, and routing information is optionally specified during the design-entry process. The implementation of highly structured designs can benefit greatly from basic floor planning.

The implementation software incorporates Timing Wizard® timing-driven placement and routing. Designers specify timing requirements along entire paths during design entry. The timing path analysis routines in PAR then recognize these user-specified requirements and accommodate them.

Timing requirements are entered on a schematic in a form directly relating to the system requirements, such as the targeted clock frequency, or the maximum allowable delay between two registers. In this way, the overall performance of the system along entire signal paths is automatically tailored to user-generated specifications. Specific timing information for individual nets is unnecessary.

## Design Verification

In addition to conventional software simulation, FPGA users can use in-circuit debugging techniques. Because Xilinx devices are infinitely reprogrammable, designs can be verified in real time without the need for extensive sets of software simulation vectors.

The development system supports both software simulation and in-circuit debugging techniques. For simulation, the system extracts the post-layout timing information from the design database, and back-annotates this information into the net list for use by the simulator. Alternatively, the user can verify timing-critical portions of the design using the TRCE® static timing analyzer.

indicating that the block SelectRAM+ memory is now disabled. The DO bus retains the last value.

### Dual Port Timing

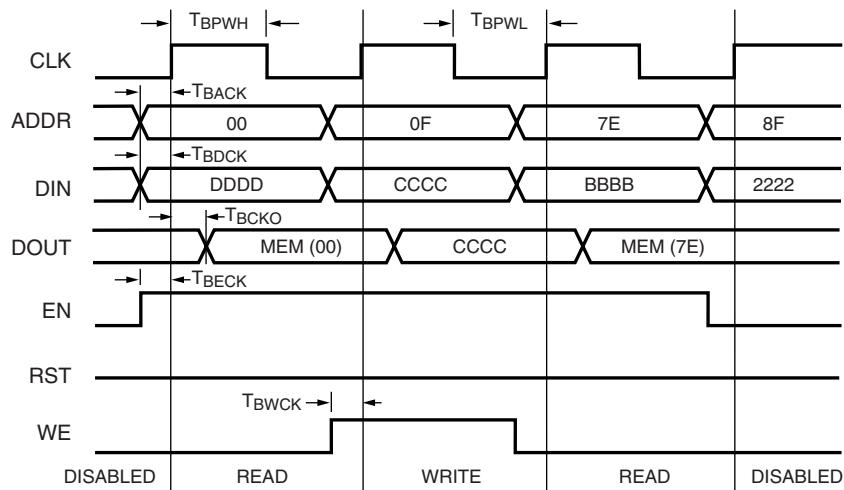

**Figure 34** shows a timing diagram for a true dual-port read/write block SelectRAM+ memory. The clock on port A has a longer period than the clock on Port B. The timing parameter  $T_{BCCS}$ , (clock-to-clock set-up) is shown on this diagram. The parameter,  $T_{BCCS}$  is violated once in the diagram. All other timing parameters are identical to the single port version shown in **Figure 33**.

$T_{BCCS}$  is only of importance when the address of both ports are the same and at least one port is performing a write operation. When the clock-to-clock set-up parameter is violated for a WRITE-WRITE condition, the contents of the memory at that location are invalid. When the clock-to-clock set-up parameter is violated for a WRITE-READ condition,

the contents of the memory are correct, but the read port has invalid data.

At the first rising edge of the CLKA, memory location 0x00 is to be written with the value 0xAAAA and is mirrored on the DOA bus. The last operation of Port B was a read to the same memory location 0x00. The DOB bus of Port B does not change with the new value on Port A, and retains the last read value. A short time later, Port B executes another read to memory location 0x00, and the DOB bus now reflects the new memory value written by Port A.

At the second rising edge of CLKA, memory location 0x7E is written with the value 0x9999 and is mirrored on the DOA bus. Port B then executes a read operation to the same memory location without violating the  $T_{BCCS}$  parameter and the DOB reflects the new memory values written by Port A.

## LVDS

Depending on whether the device is transmitting an LVDS signal or receiving an LVDS signal, there are two different circuits used for LVDS termination. A sample circuit illustrating a valid termination technique for transmitting LVDS signals appears in [Figure 54](#). A sample circuit illustrating a valid termination for receiving LVDS signals appears in [Figure 55](#). [Table 38](#) lists DC voltage specifications. Further information on the specific termination resistor packs shown can be found on [Table 40](#).

[Figure 54: Transmitting LVDS Signal Circuit](#)

[Figure 55: Receiving LVDS Signal Circuit](#)

[Table 38: LVDS Voltage Specifications](#)

Parameter	Min	Typ	Max
V <sub>CCO</sub>	2.375	2.5	2.625
V <sub>ICM</sub> <sup>(2)</sup>	0.2	1.25	2.2
V <sub>OCM</sub> <sup>(1)</sup>	1.125	1.25	1.375
V <sub>IDIFF</sub> <sup>(1)</sup>	0.1	0.35	-
V <sub>ODIFF</sub> <sup>(1)</sup>	0.25	0.35	0.45
V <sub>OH</sub> <sup>(1)</sup>	1.25	-	-
V <sub>OL</sub> <sup>(1)</sup>	-	-	1.25

### Notes:

1. Measured with a 100 Ω resistor across Q and  $\bar{Q}$ .
2. Measured with a differential input voltage =  $+/- 350$  mV.

## LVPECL

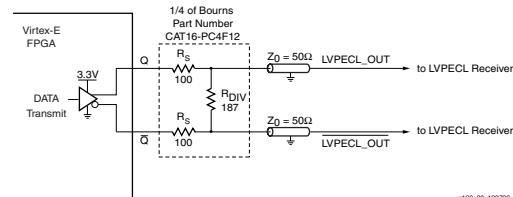

Depending on whether the device is transmitting or receiving an LVPECL signal, two different circuits are used for LVPECL termination. A sample circuit illustrating a valid termination technique for transmitting LVPECL signals appears in [Figure 56](#). A sample circuit illustrating a valid termination for receiving LVPECL signals appears in [Figure 57](#). [Table 39](#) lists DC voltage specifications. Further information on the specific termination resistor packs shown can be found on [Table 40](#).

[Table 39: LVPECL Voltage Specifications](#)

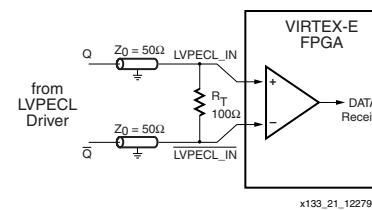

Parameter	Min	Typ	Max
V <sub>CCO</sub>	3.0	3.3	3.6
V <sub>REF</sub>	-	-	-
V <sub>TT</sub>	-	-	-
V <sub>IH</sub>	1.49	-	2.72
V <sub>IL</sub>	0.86	-	2.125
V <sub>OH</sub>	1.8	-	-
V <sub>OL</sub>	-	-	1.57

### Notes:

1. For more detailed information, see [DS022-3: Virtex-E 1.8V FPGA DC and Switching Characteristics](#), Module 3, LVPECL DC Specifications section.

			XCV1000E	2	mA	
			XCV1600E	2	mA	
			XCV2000E	2	mA	
			XCV2600E	2	mA	
			XCV3200E	2	mA	
$I_L$	Input or output leakage current		All	-10	+10	$\mu A$
$C_{IN}$	Input capacitance (sample tested)	BGA, PQ, HQ, packages	All		8	pF
$I_{RPU}$	Pad pull-up (when selected) @ $V_{in} = 0$ V, $V_{CCO} = 3.3$ V (sample tested)		All	Note 2	0.25	mA
$I_{RPD}$	Pad pull-down (when selected) @ $V_{in} = 3.6$ V (sample tested)			Note 2	0.25	mA

**Notes:**

- With no output current loads, no active input pull-up resistors, all I/O pins 3-stated and floating.
- Internal pull-up and pull-down resistors guarantee valid logic levels at unconnected input pins. These pull-up and pull-down resistors do not guarantee valid logic levels when input pins are connected to other circuits.

Table 2: IOB Input Switching Characteristics (Continued)

			Speed Grade <sup>(1)</sup>				Units			
Description <sup>(2)</sup>	Symbol	Device	Min	-8	-7	-6				
<b>Sequential Delays</b>										
<b>Clock CLK</b>										
Minimum Pulse Width, High	$T_{CH}$	All	0.56	1.2	1.3	1.4	ns, min

Clock CLK to output IQ	$T_{IOCKIQ}$		0.18	0.4	0.7	0.7	ns, max			
<b>Setup and Hold Times with respect to Clock at IOB Input Register</b>										
Pad, no delay	$T_{IOPICK}/T_{IOICKP}$	All	0.69 / 0	1.3 / 0	1.4 / 0	1.5 / 0	ns, min			
Pad, with delay	$T_{IOPICKD}/T_{IOICKPD}$	XCV50E XCV100E XCV200E XCV300E XCV400E XCV600E XCV1000E XCV1600E XCV2000E XCV2600E XCV3200E	1.25 / 0 1.25 / 0 1.33 / 0 1.33 / 0 1.37 / 0 1.49 / 0 1.49 / 0 1.53 / 0 1.53 / 0 1.53 / 0 1.53 / 0	2.8 / 0 2.8 / 0 3.0 / 0 3.0 / 0 3.1 / 0 3.4 / 0 3.4 / 0 3.5 / 0 3.5 / 0 3.5 / 0 3.5 / 0	2.9 / 0 2.9 / 0 3.1 / 0 3.1 / 0 3.2 / 0 3.5 / 0 3.5 / 0 3.6 / 0 3.6 / 0 3.6 / 0 3.6 / 0	2.9 / 0 2.9 / 0 3.1 / 0 3.1 / 0 3.2 / 0 3.5 / 0 3.5 / 0 3.6 / 0 3.6 / 0 3.6 / 0 3.6 / 0	ns, min ns, min			
ICE input	$T_{IOICECK}/T_{IOCKICE}$	All	0.28 / 0.0	0.55 / 0.01	0.7 / 0.01	0.7 / 0.01	ns, min			
SR input (IFF, synchronous)	$T_{IOSRCKI}$	All	0.38	0.8	0.9	1.0	ns, min			
<b>Set/Reset Delays</b>										
SR input to IQ (asynchronous)	$T_{IOSRIQ}$	All	0.54	1.1	1.2	1.4	ns, max			
GSR to output IQ	$T_{GSRQ}$	All	3.88	7.6	8.5	9.7	ns, max			

**Notes:**

1. A Zero "0" Hold Time listing indicates no hold time or a negative hold time. Negative values can not be guaranteed "best-case", but if a "0" is listed, there is no positive hold time.
2. Input timing i for LVTTL is measured at 1.4 V. For other I/O standards, see Table 4.

## HQ240 Differential Pin Pairs

Virtex-E devices have differential pin pairs that can also provide other functions when not used as a differential pair. A √ in the AO column indicates that the pin pair can be used as an asynchronous output for all devices provided in this package. Pairs with a note number in the AO column are device dependent. They can have asynchronous outputs if the pin pair are in the same CLB row and column in the device. Numbers in this column refer to footnotes that indicate which devices have pin pairs than can be asynchronous outputs. The Other Functions column indicates alternative function(s) not available when the pair is used as a differential pair or differential clock.

## FG676 Differential Pin Pairs

Virtex-E devices have differential pin pairs that can also provide other functions when not used as a differential pair. A √ in the AO column indicates that the pin pair can be used as an asynchronous output for all devices provided in this package. Pairs with a note number in the AO column are device dependent. They can have asynchronous outputs if the pin pair are in the same CLB row and column in the device. Numbers in this column refer to footnotes that indicate which devices have pin pairs than can be asynchronous outputs. The Other Functions column indicates alternative function(s) not available when the pair is used as a differential pair or differential clock.

**Table 21: FG676 Differential Pin Pair Summary
