

Welcome to [E-XFL.COM](#)

Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

Details

Product Status	Obsolete
Number of LABs/CLBs	6144
Number of Logic Elements/Cells	27648
Total RAM Bits	393216
Number of I/O	158
Number of Gates	1569178
Voltage - Supply	1.71V ~ 1.89V
Mounting Type	Surface Mount
Operating Temperature	0°C ~ 85°C (TJ)
Package / Case	240-BFQFP Exposed Pad
Supplier Device Package	240-PQFP (32x32)
Purchase URL	https://www.e-xfl.com/product-detail/xilinx/xcv1000e-6hq240c

forces a storage element into the initialization state specified for it in the configuration. BY forces it into the opposite state. Alternatively, these signals can be configured to operate asynchronously. All of the control signals are independently invertible, and are shared by the two flip-flops within the slice.

Additional Logic

The F5 multiplexer in each slice combines the function generator outputs. This combination provides either a function generator that can implement any 5-input function, a 4:1 multiplexer, or selected functions of up to nine inputs.

Similarly, the F6 multiplexer combines the outputs of all four function generators in the CLB by selecting one of the F5-multiplexer outputs. This permits the implementation of any 6-input function, an 8:1 multiplexer, or selected functions of up to 19 inputs.

Each CLB has four direct feedthrough paths, two per slice. These paths provide extra data input lines or additional local routing that does not consume logic resources.

Arithmetic Logic

Dedicated carry logic provides fast arithmetic carry capability for high-speed arithmetic functions. The Virtex-E CLB supports two separate carry chains, one per Slice. The height of the carry chains is two bits per CLB.

The arithmetic logic includes an XOR gate that allows a 2-bit full adder to be implemented within a slice. In addition, a dedicated AND gate improves the efficiency of multiplier implementation. The dedicated carry path can also be used to cascade function generators for implementing wide logic functions.

BUFTs

Each Virtex-E CLB contains two 3-state drivers (BUFTs) that can drive on-chip buses. See **Dedicated Routing**. Each Virtex-E BUFT has an independent 3-state control pin and an independent input pin.

Block SelectRAM

Virtex-E FPGAs incorporate large block SelectRAM memories. These complement the Distributed SelectRAM memories that provide shallow RAM structures implemented in CLBs.

Block SelectRAM memory blocks are organized in columns, starting at the left (column 0) and right outside edges and inserted every 12 CLB columns (see notes for smaller devices). Each memory block is four CLBs high, and each memory column extends the full height of the chip, immediately adjacent (to the right, except for column 0) of the CLB column locations indicated in **Table 3**.

Table 3: CLB/Block RAM Column Locations

XCV Device /Col.	0	12	24	36	48	60	72	84	96	108	120	138	156
50E	Columns 0, 6, 18, & 24												
100E	Columns 0, 12, 18, & 30												
200E	Columns 0, 12, 30, & 42												
300E	✓	✓		✓	✓								
400E	✓	✓			✓	✓							
600E	✓	✓	✓		✓	✓	✓						
1000E	✓	✓	✓				✓	✓	✓				
1600E	✓	✓	✓	✓			✓	✓	✓	✓			
2000E	✓	✓	✓	✓				✓	✓	✓	✓		
2600E	✓	✓	✓	✓					✓	✓	✓	✓	
3200E	✓	✓	✓	✓						✓	✓	✓	✓

Table 4 shows the amount of block SelectRAM memory that is available in each Virtex-E device.

Table 4: Virtex-E Block SelectRAM Amounts

Virtex-E Device	# of Blocks	Block SelectRAM Bits
XCV50E	16	65,536
XCV100E	20	81,920
XCV200E	28	114,688
XCV300E	32	131,072
XCV400E	40	163,840
XCV600E	72	294,912
XCV1000E	96	393,216
XCV1600E	144	589,824
XCV2000E	160	655,360
XCV2600E	184	753,664
XCV3200E	208	851,968

As illustrated in **Figure 6**, each block SelectRAM cell is a fully synchronous dual-ported (True Dual Port) 4096-bit RAM with independent control signals for each port. The data widths of the two ports can be configured independently, providing built-in bus-width conversion.

For in-circuit debugging, an optional download and read-back cable is available. This cable connects the FPGA in the target system to a PC or workstation. After downloading the design into the FPGA, the designer can single-step the

logic, readback the contents of the flip-flops, and so observe the internal logic state. Simple modifications can be downloaded into the system in a matter of minutes.

Configuration

Virtex-E devices are configured by loading configuration data into the internal configuration memory. Note that attempting to load an incorrect bitstream causes configuration to fail and can damage the device.

Some of the pins used for configuration are dedicated pins, while others can be re-used as general purpose inputs and outputs once configuration is complete.

The following are dedicated pins:

- Mode pins (M2, M1, M0)
- Configuration clock pin (CCLK)
- PROGRAM pin
- DONE pin
- Boundary Scan pins (TDI, TDO, TMS, TCK)

Depending on the configuration mode chosen, CCLK can be an output generated by the FPGA, or can be generated externally and provided to the FPGA as an input. The PROGRAM pin must be pulled High prior to reconfiguration.

Note that some configuration pins can act as outputs. For correct operation, these pins require a V_{CCO} of 3.3 V or 2.5 V. At 3.3 V the pins operate as LVTTL, and at 2.5 V they

operate as LVCMS. All affected pins fall in banks 2 or 3. The configuration pins needed for SelectMap (CS, Write) are located in bank 1.

Configuration Modes

Virtex-E supports the following four configuration modes.

- Slave-serial mode
- Master-serial mode
- SelectMAP mode
- Boundary Scan mode (JTAG)

The Configuration mode pins (M2, M1, M0) select among these configuration modes with the option in each case of having the IOB pins either pulled up or left floating prior to configuration. The selection codes are listed in [Table 8](#).

Configuration through the Boundary Scan port is always available, independent of the mode selection. Selecting the Boundary Scan mode simply turns off the other modes. The three mode pins have internal pull-up resistors, and default to a logic High if left unconnected. However, it is recommended to drive the configuration mode pins externally.

Table 8: Configuration Codes

Configuration Mode	M2 ⁽¹⁾	M1	M0	CCLK Direction	Data Width	Serial D _{out}	Configuration Pull-ups ⁽¹⁾
Master-serial mode	0	0	0	Out	1	Yes	No
Boundary Scan mode	1	0	1	N/A	1	No	No
SelectMAP mode	1	1	0	In	8	No	No
Slave-serial mode	1	1	1	In	1	Yes	No
Master-serial mode	1	0	0	Out	1	Yes	Yes
Boundary Scan mode	0	0	1	N/A	1	No	Yes
SelectMAP mode	0	1	0	In	8	No	Yes
Slave-serial mode	0	1	1	In	1	Yes	Yes

Notes:

1. M2 is sampled continuously from power up until the end of the configuration. Toggling M2 while INIT is being held externally Low can cause the configuration pull-up settings to change.

ground. As the DLL delay taps reset to zero, glitches can occur on the DLL clock output pins. Activation of the RST pin can also severely affect the duty cycle of the clock output pins. Furthermore, the DLL output clocks no longer deskew with respect to one another. For these reasons, rarely use the reset pin unless re-configuring the device or changing the input frequency.

2x Clock Output — CLK2X

The output pin CLK2X provides a frequency-doubled clock with an automatic 50/50 duty-cycle correction. Until the CLKDLL has achieved lock, the CLK2X output appears as a 1x version of the input clock with a 25/75 duty cycle. This behavior allows the DLL to lock on the correct edge with respect to source clock. This pin is not available on the CLKDLLHF primitive.

Clock Divide Output — CLKDV

The clock divide output pin CLKDV provides a lower frequency version of the source clock. The CLKDV_DIVIDE property controls CLKDV such that the source clock is divided by N where N is either 1.5, 2, 2.5, 3, 4, 5, 8, or 16.

This feature provides automatic duty cycle correction such that the CLKDV output pin always has a 50/50 duty cycle, with the exception of noninteger divides in HF mode, where the duty cycle is 1/3 for N=1.5 and 2/5 for N=2.5.

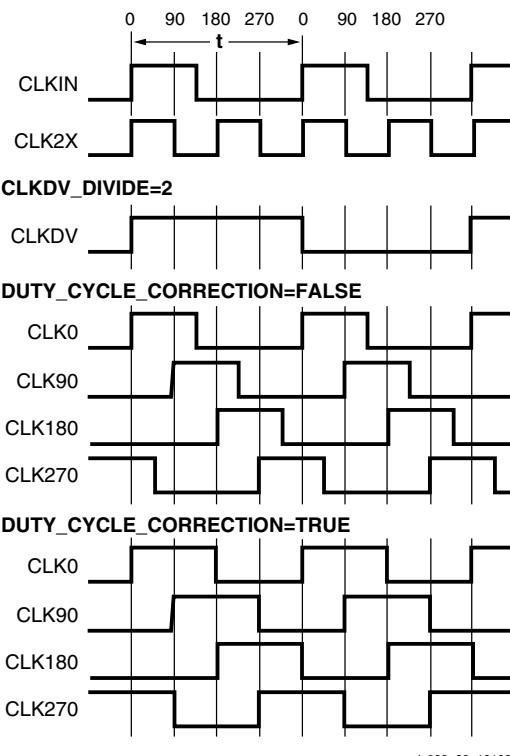

1x Clock Outputs — CLK[0|90|180|270]

The 1x clock output pin CLK0 represents a delay-compensated version of the source clock (CLKIN) signal. The CLKDLL primitive provides three phase-shifted versions of the CLK0 signal while CLKDLLHF provides only the 180° phase-shifted version. The relationship between phase shift and the corresponding period shift appears in Table 13.

Table 13: Relationship of Phase-Shifted Output Clock to Period Shift

Phase (degrees)	Period Shift (percent)
0	0%
90	25%
180	50%
270	75%

The timing diagrams in Figure 25 illustrate the DLL clock output characteristics.

ds022_29_121099

Figure 25: DLL Output Characteristics

The DLL provides duty cycle correction on all 1x clock outputs such that all 1x clock outputs by default have a 50/50 duty cycle. The DUTY_CYCLE_CORRECTION property (TRUE by default), controls this feature. In order to deactivate the DLL duty cycle correction, attach the DUTY_CYCLE_CORRECTION=FALSE property to the DLL symbol. When duty cycle correction deactivates, the output clock has the same duty cycle as the source clock.

The DLL clock outputs can drive an OBUF, a BUFG, or they can route directly to destination clock pins. The DLL clock outputs can only drive the BUFGs that reside on the same edge (top or bottom).

Locked Output — LOCKED

To achieve lock, the DLL might need to sample several thousand clock cycles. After the DLL achieves lock, the LOCKED signal activates. The DLL timing parameter section of the data sheet provides estimates for locking times.

To guarantee that the system clock is established prior to the device “waking up,” the DLL can delay the completion of the device configuration process until after the DLL locks. The STARTUP_WAIT property activates this feature.

Until the LOCKED signal activates, the DLL output clocks are not valid and can exhibit glitches, spikes, or other spurious movement. In particular the CLK2X output appears as a 1x clock with a 25/75 duty cycle.

Useful Application Examples

The Virtex-E DLL can be used in a variety of creative and useful applications. The following examples show some of the more common applications. The Verilog and VHDL example files are available at:

[ftp://ftp.xilinx.com/pub/applications/xapp/xapp132.zip](http://ftp.xilinx.com/pub/applications/xapp/xapp132.zip)

Standard Usage

The circuit shown in [Figure 27](#) resembles the BUFGDLL macro implemented to provide access to the RST and LOCKED pins of the CLKDLL.

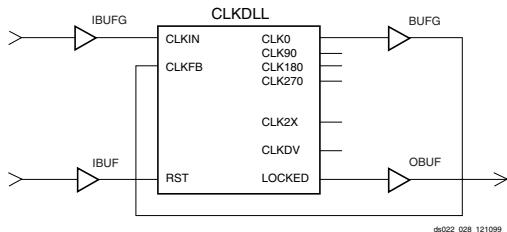

Figure 27: Standard DLL Implementation

Board Level Deskew of Multiple Non-Virtex-E Devices

The circuit shown in [Figure 28](#) can be used to deskew a system clock between a Virtex-E chip and other non-Virtex-E chips on the same board. This application is commonly used when the Virtex-E device is used in conjunction with other standard products such as SRAM or DRAM devices. While designing the board level route, ensure that the return net delay to the source equals the delay to the other chips involved.

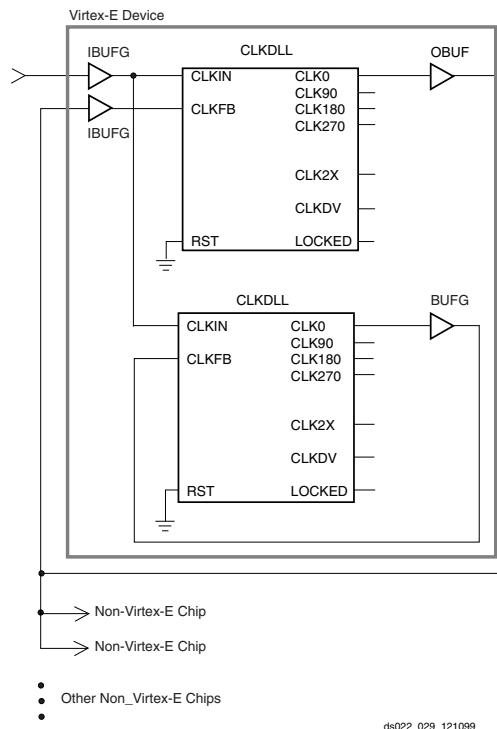

Figure 28: DLL Deskew of Board Level Clock

Board-level deskew is not required for low-fanout clock networks. It is recommended for systems that have fanout limitations on the clock network, or if the clock distribution chip cannot handle the load.

Do not use the DLL output clock signals until after activation of the LOCKED signal. Prior to the activation of the LOCKED signal, the DLL output clocks are not valid and can exhibit glitches, spikes, or other spurious movement.

The `dll_mirror_1` files in the [xapp132.zip](#) file show the VHDL and Verilog implementation of this circuit.

Deskew of Clock and Its 2x Multiple

The circuit shown in [Figure 29](#) implements a 2x clock multiplier and also uses the CLK0 clock output with a zero ns skew between registers on the same chip. Alternatively, a clock divider circuit can be implemented using similar connections.

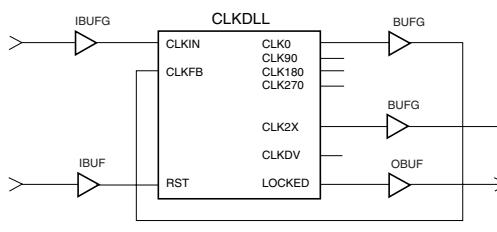

Figure 29: DLL Deskew of Clock and 2x Multiple

Virtex-E Data Sheet

The Virtex-E Data Sheet contains the following modules:

Global Clock Set-Up and Hold for LVTTL Standard, *without DLL*

Description ⁽¹⁾	Symbol	Device	Speed Grade ^(2, 3)				Units
			Min	-8	-7	-6	
Input Setup and Hold Time Relative to Global Clock Input Signal for LVTTL Standard. For data input with different standards, adjust the setup time delay by the values shown in IOB Input Switching Characteristics Standard Adjustments , page 8.							
Full Delay Global Clock and IFF, without DLL	T_{PSFD}/T_{PHFD}	XCV50E	1.8 / 0	1.8 / 0	1.8 / 0	1.8 / 0	ns
		XCV100E	1.8 / 0	1.8 / 0	1.8 / 0	1.8 / 0	ns
		XCV200E	1.9 / 0	1.9 / 0	1.9 / 0	1.9 / 0	ns
		XCV300E	2.0 / 0	2.0 / 0	2.0 / 0	2.0 / 0	ns
		XCV400E	2.0 / 0	2.0 / 0	2.0 / 0	2.0 / 0	ns
		XCV600E	2.1 / 0	2.1 / 0	2.1 / 0	2.1 / 0	ns
		XCV1000E	2.3 / 0	2.3 / 0	2.3 / 0	2.3 / 0	ns
		XCV1600E	2.5 / 0	2.5 / 0	2.5 / 0	2.5 / 0	ns
		XCV2000E	2.5 / 0	2.5 / 0	2.5 / 0	2.5 / 0	ns
		XCV2600E	2.7 / 0	2.7 / 0	2.7 / 0	2.7 / 0	ns
		XCV3200E	2.8 / 0	2.8 / 0	2.8 / 0	2.8 / 0	ns

Notes:

1. IFF = Input Flip-Flop or Latch
2. Setup time is measured relative to the Global Clock input signal with the fastest route and the lightest load. Hold time is measured relative to the Global Clock input signal with the slowest route and heaviest load.
3. A Zero "0" Hold Time listing indicates no hold time or a negative hold time. Negative values can not be guaranteed "best-case", but if a "0" is listed, there is no positive hold time.

BG560 Ball Grid Array Packages

XCV1000E, XCV1600E, and XCV2000E devices in BG560 Ball Grid Array packages have footprint compatibility. Pins labeled I_O_VREF can be used as either in all parts unless device-dependent as indicated in the footnotes. If the pin is not used as V_{REF} it can be used as general I/O. Immediately following Table 14, see Table 15 for Differential Pair information.

FG456 Fine-Pitch Ball Grid Array Packages

XCV200E and XCV300E devices in FG456 fine-pitch Ball Grid Array packages have footprint compatibility. Pins labeled IO_VREF can be used as either in both devices provided in this package. If the pin is not used as V_{REF} , it can be used as general I/O. Immediately following Table 18, see Table 19 for Differential Pair information.

Notes:

1. NC in the XCV400E.
2. V_{REF} or I/O option only in the XCV600E; otherwise, I/O option only.

FG860 Differential Pin Pairs

Virtex-E devices have differential pin pairs that can also provide other functions when not used as a differential pair. A √ in the AO column indicates that the pin pair can be used as an asynchronous output for all devices provided in this package. Pairs with a note number in the AO column are device dependent. They can have asynchronous outputs if the pin pair are in the same CLB row and column in the device. Numbers in this column refer to footnotes that indicate which devices have pin pairs than can be asynchronous outputs. The Other Functions column indicates alternative function(s) not available when the pair is used as a differential pair or differential clock.

Date	Version	Revision
4/2/01	2.0	<ul style="list-style-type: none"> Updated numerous values in Virtex-E Switching Characteristics tables. Changed pinout table footnotes from "V_{REF} option only" to "V_{REF} or I/O option only" to improve clarity. Converted file to modularized format. See the Virtex-E Data Sheet section.
7/26/01	2.1	<ul style="list-style-type: none"> Changed pinout table footnotes from "V_{REF} or I/O option only" to "V_{REF} or I/O option only; otherwise I/O only" to improve clarity. Changed designation for pin pair 300 in Table 29 from AO to footnote 9.
10/25/01	2.2	<ul style="list-style-type: none"> Changed Table 29 to clarify which devices in the FG1156 package can use each pin pair as an asynchronous output. Updated references to the XCV3200E device in the FG1156 package.
11/15/01	2.3	<ul style="list-style-type: none"> Fixed cosmetic error.
07/17/02	2.4	<ul style="list-style-type: none"> Added "VREF" to the description for pin B15 in Table 12. Changed designation for pin pair 129 in Table 15 from AO to "AO in the XCV1000E, 1600E, 2000E". Data sheet designation upgraded from Preliminary to Production.
03/14/03	2.5	<ul style="list-style-type: none"> Removed the Virtex-E XCV300E section under Pinout Differences Between Virtex and Virtex-E Families (and revised Table 1), since these differences do not exist.

Virtex-E Data Sheet

The Virtex-E Data Sheet contains the following modules:

- DS022-1, Virtex-E 1.8V FPGAs:
[Introduction and Ordering Information \(Module 1\)](#)
- DS022-2, Virtex-E 1.8V FPGAs:
[Functional Description \(Module 2\)](#)
- DS022-3, Virtex-E 1.8V FPGAs:
[DC and Switching Characteristics \(Module 3\)](#)
- DS022-4, Virtex-E 1.8V FPGAs:
[Pinout Tables \(Module 4\)](#)
