### **Understanding Embedded - FPGAs (Field Programmable Gate Array)**

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

### **Applications of Embedded - FPGAs**

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

resources. The abundance of routing resources permits the Virtex-E family to accommodate even the largest and most complex designs.

Virtex-E FPGAs are SRAM-based, and are customized by loading configuration data into internal memory cells. Configuration data can be read from an external SPROM (master serial mode), or can be written into the FPGA (SelectMAP™, slave serial, and JTAG modes).

The standard Xilinx Foundation Series™ and Alliance Series™ Development systems deliver complete design support for Virtex-E, covering every aspect from behavioral and schematic entry, through simulation, automatic design translation and implementation, to the creation and downloading of a configuration bit stream.

### Higher Performance

Virtex-E devices provide better performance than previous generations of FPGAs. Designs can achieve synchronous system clock rates up to 240 MHz including I/O or 622 Mb/s using Source Synchronous data transmission architectures. Virtex-E I/Os comply fully with 3.3 V PCI specifications, and interfaces can be implemented that operate at 33 MHz or 66 MHz.

While performance is design-dependent, many designs operate internally at speeds in excess of 133 MHz and can achieve over 311 MHz. **Table 2** shows performance data for representative circuits, using worst-case timing parameters.

## Useful Application Examples

The Virtex-E DLL can be used in a variety of creative and useful applications. The following examples show some of the more common applications. The Verilog and VHDL example files are available at:

[ftp://ftp.xilinx.com/pub/applications/xapp/xapp132.zip](http://ftp.xilinx.com/pub/applications/xapp/xapp132.zip)

### Standard Usage

The circuit shown in [Figure 27](#) resembles the BUFGDLL macro implemented to provide access to the RST and LOCKED pins of the CLKDLL.

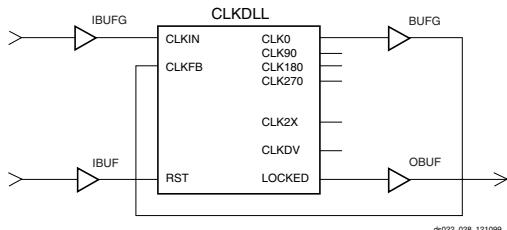

Figure 27: Standard DLL Implementation

### Board Level Deskew of Multiple Non-Virtex-E Devices

The circuit shown in [Figure 28](#) can be used to deskew a system clock between a Virtex-E chip and other non-Virtex-E chips on the same board. This application is commonly used when the Virtex-E device is used in conjunction with other standard products such as SRAM or DRAM devices. While designing the board level route, ensure that the return net delay to the source equals the delay to the other chips involved.

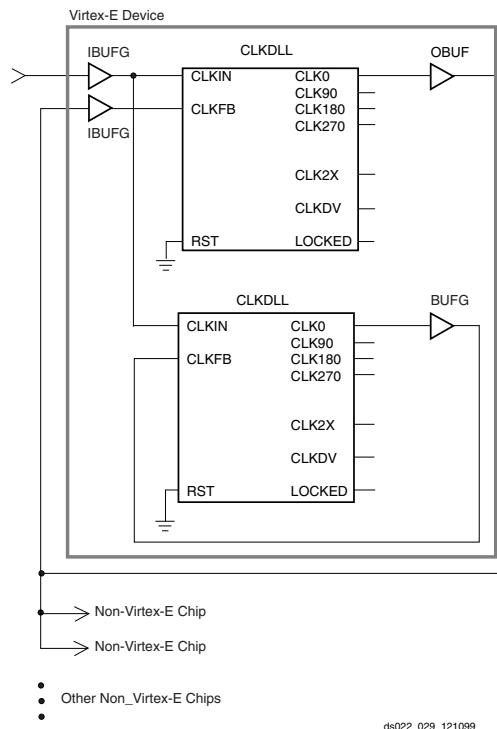

Figure 28: DLL Deskew of Board Level Clock

Board-level deskew is not required for low-fanout clock networks. It is recommended for systems that have fanout limitations on the clock network, or if the clock distribution chip cannot handle the load.

Do not use the DLL output clock signals until after activation of the LOCKED signal. Prior to the activation of the LOCKED signal, the DLL output clocks are not valid and can exhibit glitches, spikes, or other spurious movement.

The `dll_mirror_1` files in the [xapp132.zip](#) file show the VHDL and Verilog implementation of this circuit.

### Deskew of Clock and Its 2x Multiple

The circuit shown in [Figure 29](#) implements a 2x clock multiplier and also uses the CLK0 clock output with a zero ns skew between registers on the same chip. Alternatively, a clock divider circuit can be implemented using similar connections.

## Using SelectI/O

The Virtex-E FPGA series includes a highly configurable, high-performance I/O resource, called SelectI/O™ to provide support for a wide variety of I/O standards. The SelectI/O resource is a robust set of features including programmable control of output drive strength, slew rate, and input delay and hold time. Taking advantage of the flexibility and SelectI/O features and the design considerations described in this document can improve and simplify system level design.

### Introduction

As FPGAs continue to grow in size and capacity, the larger and more complex systems designed for them demand an increased variety of I/O standards. Furthermore, as system clock speeds continue to increase, the need for high performance I/O becomes more important.

While chip-to-chip delays have an increasingly substantial impact on overall system speed, the task of achieving the desired system performance becomes more difficult with the proliferation of low-voltage I/O standards. SelectI/O, the revolutionary input/output resources of Virtex-E devices, resolve this potential problem by providing a highly configurable, high-performance alternative to the I/O resources of more conventional programmable devices. Virtex-E SelectI/O features combine the flexibility and time-to-market advantages of programmable logic with the high performance previously available only with ASICs and custom ICs.

Each SelectI/O block can support up to 20 I/O standards. Supporting such a variety of I/O standards allows the support of a wide variety of applications, from general purpose standard applications to high-speed low-voltage memory buses.

SelectI/O blocks also provide selectable output drive strengths and programmable slew rates for the LVTTL output buffers, as well as an optional, programmable weak pull-up, weak pull-down, or weak “keeper” circuit ideal for use in external bussing applications.

Each Input/Output Block (IOB) includes three registers, one each for the input, output, and 3-state signals within the IOB. These registers are optionally configurable as either a D-type flip-flop or as a level sensitive latch.

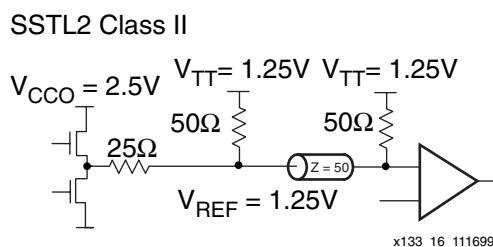

The input buffer has an optional delay element used to guarantee a zero hold time requirement for input signals registered within the IOB.

The Virtex-E SelectI/O features also provide dedicated resources for input reference voltage ( $V_{REF}$ ) and output source voltage ( $V_{CCO}$ ), along with a convenient banking system that simplifies board design.

By taking advantage of the built-in features and wide variety of I/O standards supported by the SelectI/O features, system-level design and board design can be greatly simplified and improved.

## Power-On Power Supply Requirements

Xilinx FPGAs require a certain amount of supply current during power-on to insure proper device operation. The actual current consumed depends on the power-on ramp rate of the power supply. This is the time required to reach the nominal power supply voltage of the device<sup>1</sup> from 0V. The fastest ramp rate is 0V to nominal voltage in 2 ms, and the slowest allowed ramp rate is 0V to nominal voltage in 50 ms. For more details on power supply requirements, see XAPP158 on [www.xilinx.com](http://www.xilinx.com).

Product (Commercial Grade)	Description <sup>(2)</sup>	Current Requirement <sup>(3)</sup>
XCV50E - XCV600E	Minimum required current supply	500 mA
XCV812E - XCV2000E	Minimum required current supply	1 A
XCV2600E - XCV3200E	Minimum required current supply	1.2 A
Virtex-E Family, Industrial Grade	Minimum required current supply	2 A

**Notes:**

1. Ramp rate used for this specification is from 0 - 1.8 V DC. Peak current occurs on or near the internal power-on reset threshold and lasts for less than 3 ms.
2. Devices are guaranteed to initialize properly with the minimum current available from the power supply as noted above.
3. Larger currents might result if ramp rates are forced to be faster.

## DC Input and Output Levels

Values for  $V_{IL}$  and  $V_{IH}$  are recommended input voltages. Values for  $I_{OL}$  and  $I_{OH}$  are guaranteed over the recommended operating conditions at the  $V_{OL}$  and  $V_{OH}$  test points. Only selected standards are tested. These are chosen to ensure that all standards meet their specifications. The selected standards are tested at minimum  $V_{CCO}$  with the respective  $V_{OL}$  and  $V_{OH}$  voltage levels shown. Other standards are sample tested.
