Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

Details	
Product Status	Obsolete
Number of LABs/CLBs	6144
Number of Logic Elements/Cells	27648
Total RAM Bits	393216
Number of I/O	660
Number of Gates	1569178
Voltage - Supply	1.71V ~ 1.89V
Mounting Type	Surface Mount
Operating Temperature	-40°C ~ 100°C (TJ)
Package / Case	900-BBGA
Supplier Device Package	900-FBGA (31x31)
Purchase URL	https://www.e-xfl.com/product-detail/xilinx/xcv1000e-7fg900i

Table 9 lists the total number of bits required to configure each device.

Table 9: **Virtex-E Bitstream Lengths**

Device	# of Configuration Bits
XCV50E	630,048
XCV100E	863,840
XCV200E	1,442,016
XCV300E	1, 875,648
XCV400E	2,693,440
XCV600E	3,961,632
XCV1000E	6,587,520
XCV1600E	8,308,992
XCV2000E	10,159,648
XCV2600E	12,922,336
XCV3200E	16,283,712

Slave-Serial Mode

In slave-serial mode, the FPGA receives configuration data in bit-serial form from a serial PROM or other source of serial configuration data. The serial bitstream must be set up at the DIN input pin a short time before each rising edge of an externally generated CCLK.

For more detailed information on serial PROMs, see the PROM data sheet at **http://www.xilinx.com/bvdocs/publications/ds026.pdf**.

Multiple FPGAs can be daisy-chained for configuration from a single source. After a particular FPGA has been configured, the data for the next device is routed to the DOUT pin. The maximum capacity for a single LOUT/DOUT write is 2^{20}-1 (1,048,575) 32-bit words, or 33,554,4000 bits. The data on the DOUT pin changes on the rising edge of CCLK.

The change of DOUT on the rising edge of CCLK differs from previous families, but does not cause a problem for mixed configuration chains. This change was made to improve serial configuration rates for Virtex and Virtex-E only chains.

Figure 13 shows a full master/slave system. A Virtex-E device in slave-serial mode should be connected as shown in the right-most device.

Slave-serial mode is selected by applying <111> or <011> to the mode pins (M2, M1, M0). A weak pull-up on the mode pins makes slave serial the default mode if the pins are left unconnected. However, it is recommended to drive the configuration mode pins externally. Figure 14 shows slave-serial mode programming switching characteristics.

Table 10 provides more detail about the characteristics shown in Figure 14. Configuration must be delayed until the $\overline{\text{INIT}}$ pins of all daisy-chained FPGAs are High.

Table 10: **Master/Slave Serial Mode Programming Switching**

	Description	Figure References	Symbol	Values	Units
CCLK	DIN setup/hold, slave mode	1/2	T_{DCC}/T_{CCD}	5.0 / 0.0	ns, min
	DIN setup/hold, master mode	1/2	T_{DSCK}/T_{CKDS}	5.0 / 0.0	ns, min
	DOUT	3	T_{CCO}	12.0	ns, max
	High time	4	T_{CCH}	5.0	ns, min
	Low time	5	T_{CCL}	5.0	ns, min
	Maximum Frequency		F_{CC}	66	MHz, max
	Frequency Tolerance, master mode with respect to nominal			+45% –30%	

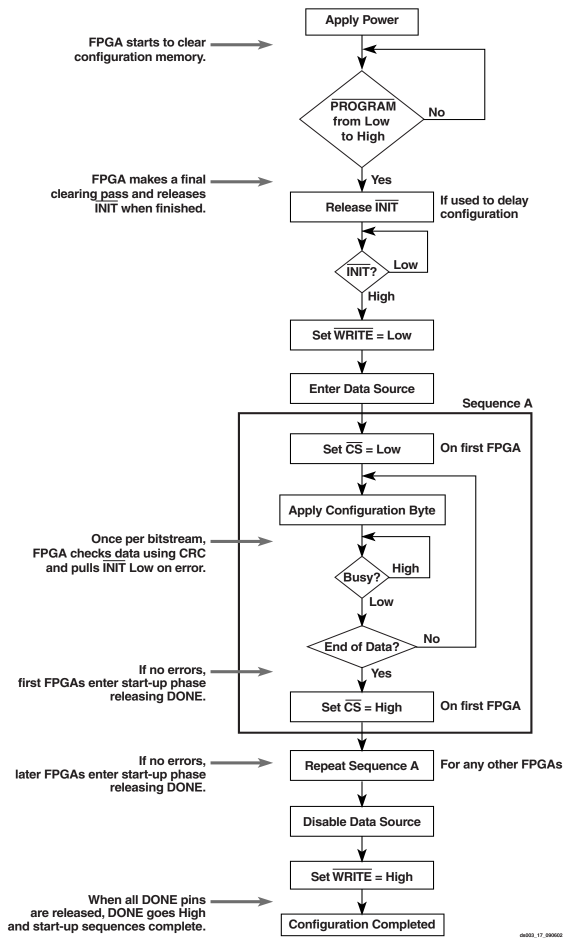

Figure 18: **SelectMAP Flowchart for Write Operations**

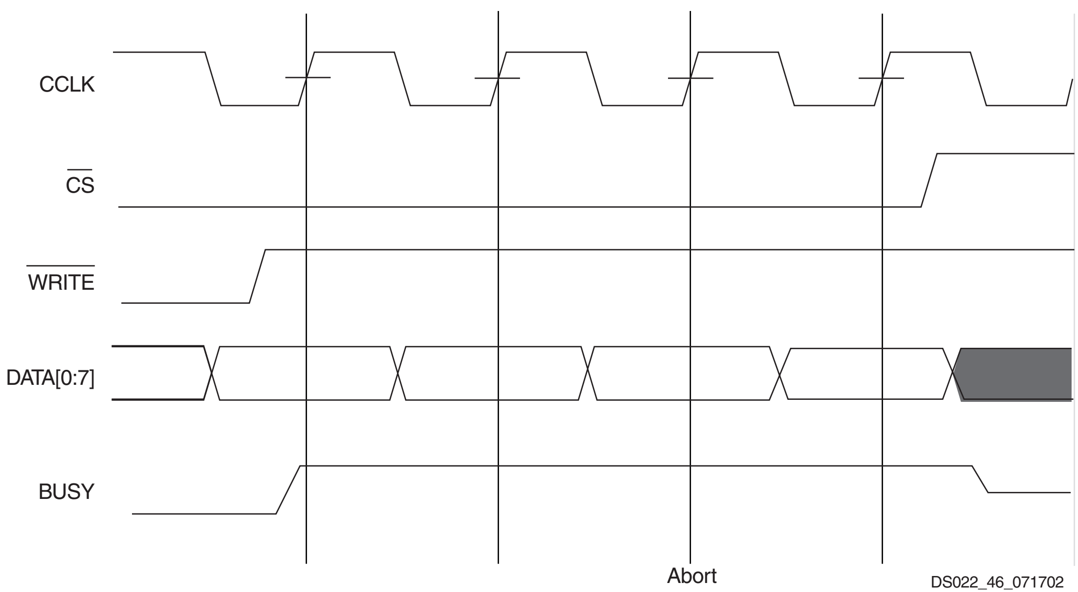

Figure 19: **SelectMAP Write Abort Waveforms**

Boundary Scan Mode

In the Boundary Scan mode, configuration is done through the IEEE 1149.1 Test Access Port. Note that the PROGRAM pin must be pulled High prior to reconfiguration. A Low on the PROGRAM pin resets the TAP controller and no JTAG operations can be performed.

Fundamentals

Modern bus applications, pioneered by the largest and most influential companies in the digital electronics industry, are commonly introduced with a new I/O standard tailored specifically to the needs of that application. The bus I/O standards provide specifications to other vendors who create products designed to interface with these applications. Each standard often has its own specifications for current, voltage, I/O buffering, and termination techniques.

The ability to provide the flexibility and time-to-market advantages of programmable logic is increasingly dependent on the capability of the programmable logic device to support an ever increasing variety of I/O standards

The SelectI/O resources feature highly configurable input and output buffers which provide support for a wide variety of I/O standards. As shown in Table 18, each buffer type can support a variety of voltage requirements.

Table 18: **Virtex-E Supported I/O Standards**

I/O Standard	Output V_{CCO}	Input V_{CCO}	Input V_{REF}	Board Termination Voltage (V_{TT})
LVTTL	3.3	3.3	N/A	N/A
LVCMOS2	2.5	2.5	N/A	N/A
LVCMOS18	1.8	1.8	N/A	N/A
SSTL3 I & II	3.3	N/A	1.50	1.50
SSTL2 I & II	2.5	N/A	1.25	1.25
GTL	N/A	N/A	0.80	1.20
GTL+	N/A	N/A	1.0	1.50
HSTL I	1.5	N/A	0.75	0.75
HSTL III & IV	1.5	N/A	0.90	1.50
CTT	3.3	N/A	1.50	1.50
AGP-2X	3.3	N/A	1.32	N/A
PCI33_3	3.3	3.3	N/A	N/A
PCI66_3	3.3	3.3	N/A	N/A
BLVDS & LVDS	2.5	N/A	N/A	N/A
LVPECL	3.3	N/A	N/A	N/A

Overview of Supported I/O Standards

This section provides a brief overview of the I/O standards supported by all Virtex-E devices.

While most I/O standards specify a range of allowed voltages, this document records typical voltage values only. Detailed information on each specification can be found on the Electronic Industry Alliance Jedec website at:

http://www.jedec.org

LVTTL — Low-Voltage TTL

The Low-Voltage TTL, or LVTTL standard is a general purpose EIA/JESDSA standard for 3.3V applications that uses an LVTTL input buffer and a Push-Pull output buffer. This standard requires a 3.3V output source voltage (V_{CCO}), but does not require the use of a reference voltage (V_{REF}) or a termination voltage (V_{TT}).

LVCMOS2 — Low-Voltage CMOS for 2.5 Volts

The Low-Voltage CMOS for 2.5 Volts or lower, or LVCMOS2 standard is an extension of the LVCMOS standard (JESD 8.-5) used for general purpose 2.5V applications. This standard requires a 2.5V output source voltage (V_{CCO}), but does not require the use of a reference voltage (V_{REF}) or a board termination voltage (V_{TT}).

LVCMOS18 — 1.8 V Low Voltage CMOS

This standard is an extension of the LVCMOS standard. It is used in general purpose 1.8 V applications. The use of a reference voltage (V_{REF}) or a board termination voltage (V_{TT}) is not required.

PCI — Peripheral Component Interface

The Peripheral Component Interface, or PCI standard specifies support for both 33 MHz and 66 MHz PCI bus applications. It uses a LVTTL input buffer and a Push-Pull output buffer. This standard does not require the use of a reference voltage (V_{REF}) or a board termination voltage (V_{TT}), however, it does require a 3.3V output source voltage (V_{CCO}).

GTL — Gunning Transceiver Logic Terminated

The Gunning Transceiver Logic, or GTL standard is a high-speed bus standard (JESD8.3) invented by Xerox. Xilinx has implemented the terminated variation for this standard. This standard requires a differential amplifier input buffer and a Open Drain output buffer.

GTL+ — Gunning Transceiver Logic Plus

The Gunning Transceiver Logic Plus, or GTL+ standard is a high-speed bus standard (JESD8.3) first used by the Pentium Pro processor.

HSTL — High-Speed Transceiver Logic

The High-Speed Transceiver Logic, or HSTL standard is a general purpose high-speed, 1.5V bus standard sponsored by IBM (EIA/JESD 8-6). This standard has four variations or classes. SelectI/O devices support Class I, III, and IV. This standard requires a Differential Amplifier input buffer and a Push-Pull output buffer.

SSTL3 — Stub Series Terminated Logic for 3.3V

The Stub Series Terminated Logic for 3.3V, or SSTL3 standard is a general purpose 3.3V memory bus standard also sponsored by Hitachi and IBM (JESD8-8). This standard has two classes, I and II. SelectI/O devices support both classes for the SSTL3 standard. This standard requires a Differential Amplifier input buffer and an Push-Pull output buffer.

SSTL2 — Stub Series Terminated Logic for 2.5V

The Stub Series Terminated Logic for 2.5V, or SSTL2 standard is a general purpose 2.5V memory bus standard sponsored by Hitachi and IBM (JESD8-9). This standard has two classes, I and II. SelectI/O devices support both classes for the SSTL2 standard. This standard requires a Differential Amplifier input buffer and an Push-Pull output buffer.

CTT — Center Tap Terminated

The Center Tap Terminated, or CTT standard is a 3.3V memory bus standard sponsored by Fujitsu (JESD8-4). This standard requires a Differential Amplifier input buffer and a Push-Pull output buffer.

AGP-2X — Advanced Graphics Port

The Intel AGP standard is a 3.3V Advanced Graphics Port-2X bus standard used with the Pentium II processor for graphics applications. This standard requires a Push-Pull output buffer and a Differential Amplifier input buffer.

LVDS — Low Voltage Differential Signal

LVDS is a differential I/O standard. It requires that one data bit is carried through two signal lines. As with all differential signaling standards, LVDS has an inherent noise immunity over single-ended I/O standards. The voltage swing between two signal lines is approximately 350mV. The use of a reference voltage (V_{REF}) or a board termination voltage (V_{TT}) is not required. LVDS requires the use of two pins per input or output. LVDS requires external resistor termination.

BLVDS — Bus LVDS

This standard allows for bidirectional LVDS communication between two or more devices. The external resistor termination is different than the one for standard LVDS.

LVPECL — Low Voltage Positive Emitter Coupled Logic

LVPECL is another differential I/O standard. It requires two signal lines for transmitting one data bit. This standard specifies two pins per input or output. The voltage swing between these two signal lines is approximately 850 mV. The use of a reference voltage (V_{REF}) or a board termination voltage (V_{TT}) is not required. The LVPECL standard requires external resistor termination.

Library Symbols

The Xilinx library includes an extensive list of symbols designed to provide support for the variety of SelectI/O features. Most of these symbols represent variations of the five generic SelectI/O symbols.

- IBUF (input buffer)
- IBUFG (global clock input buffer)
- OBUF (output buffer)
- OBUFT (3-state output buffer)
- IOBUF (input/output buffer)

IBUF

Signals used as inputs to the Virtex-E device must source an input buffer (IBUF) via an external input port. The generic Virtex-E IBUF symbol appears in Figure 37. The extension to the base name defines which I/O standard the IBUF uses. The assumed standard is LVTTL when the generic IBUF has no specified extension.

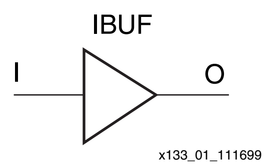

Figure 37: **Input Buffer (IBUF) Symbols**

The following list details the variations of the IBUF symbol:

- IBUF
- IBUF_LVCMOS2
- IBUF_PCI33_3
- IBUF_PCI66_3
- IBUF_GTL
- IBUF_GTLP
- IBUF_HSTL_I
- IBUF_HSTL_III
- IBUF_HSTL_IV
- IBUF_SSTL3_I
- IBUF_SSTL3_II
- IBUF_SSTL2_I
- IBUF_SSTL2_II
- IBUF_CTT
- IBUF_AGP
- IBUF_LVCMOS18
- IBUF_LVDS
- IBUF_LVPECL

When the IBUF symbol supports an I/O standard that requires a V_{REF}, the IBUF automatically configures as a differential amplifier input buffer. The V_{REF} voltage must be supplied on the V_{REF} pins. In the case of LVDS, LVPECL, and BLVDS, V_{REF} is not required.

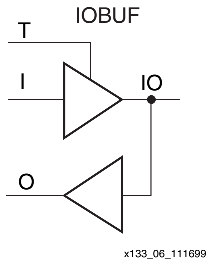

Figure 42: **Input/Output Buffer Symbol (IOBUF)**

The following list details variations of the IOBUF symbol.

- IOBUF
- IOBUF_S_2
- IOBUF_S_4
- IOBUF_S_6
- IOBUF_S_8
- IOBUF_S_12
- IOBUF_S_16
- IOBUF_S_24
- IOBUF_F_2
- IOBUF_F_4
- IOBUF_F_6
- IOBUF_F_8
- IOBUF_F_12
- IOBUF_F_16
- IOBUF_F_24
- IOBUF_LVCMOS2
- IOBUF_PCI33_3
- IOBUF_PCI66_3
- IOBUF_GTL
- IOBUF_GTLP
- IOBUF_HSTL_I
- IOBUF_HSTL_III
- IOBUF_HSTL_IV
- IOBUF_SSTL3_I
- IOBUF_SSTL3_II
- IOBUF_SSTL2_I
- IOBUF_SSTL2_II
- IOBUF_CTT
- IOBUF_AGP
- IOBUF_LVCMOS18
- IOBUF_LVDS
- IOBUF_LVPECL

When the IOBUF symbol used supports an I/O standard that requires a differential amplifier input, the IOBUF automatically configures with a differential amplifier input buffer.

The low-voltage I/O standards with a differential amplifier input require an external reference voltage input V_{REF}.

The voltage reference signal is "banked" within the Virtex-E device on a half-edge basis such that for all packages there are eight independent V_{REF} banks internally. See Figure 38, page 34 for a representation of the Virtex-E I/O banks. Within each bank approximately one of every six I/O pins is automatically configured as a V_{REF} input. After placing a differential amplifier input signal within a given V_{REF} bank, the same external source must drive all I/O pins configured as a V_{REF} input.

IOBUF placement restrictions require any differential amplifier input signals within a bank be of the same standard.

The Virtex-E series supports eight banks for the HQ and PQ packages. The CS package supports four V_{CCO} banks.

Additional restrictions on the Virtex-E SelectI/O IOBUF placement require that within a given V_{CCO} bank each IOBUF must share the same output source drive voltage. Input buffers of any type and output buffers that do not require V_{CCO} can be placed within the same V_{CCO} bank. The LOC property can specify a location for the IOBUF.

An optional delay element is associated with the input path in each IOBUF. When the IOBUF drives an input flip-flop within the IOB, the delay element activates by default to ensure a zero hold-time requirement. Override this default with the NODELAY=TRUE property.

In the case when the IOBUF does not drive an input flip-flop within the IOB, the delay element de-activates by default to provide higher performance. To delay the input signal, activate the delay element with the DELAY=TRUE property.

3-state output buffers and bidirectional buffers can have either a weak pull-up resistor, a weak pull-down resistor, or a weak "keeper" circuit. Control this feature by adding the appropriate symbol to the output net of the IOBUF (PULLUP, PULLDOWN, or KEEPER).

SelectI/O Properties

Access to some of the SelectI/O features (for example, location constraints, input delay, output drive strength, and slew rate) is available through properties associated with these features.

Input Delay Properties

An optional delay element is associated with each IBUF. When the IBUF drives a flip-flop within the IOB, the delay element activates by default to ensure a zero hold-time requirement. Use the NODELAY=TRUE property to override this default.

In the case when the IBUF does not drive a flip-flop within the IOB, the delay element by default de-activates to provide higher performance. To delay the input signal, activate the delay element with the DELAY=TRUE property.

DC Characteristics Over Recommended Operating Conditions

Symbol	Description		Device	Min	Max	Units
V_{DRINT}	Data Retention V_{CCINT} Voltage (below which configuration data might be lost)		All	1.5		V
V_{DRIO}	Data Retention V_{CCO} Voltage (below which configuration data might be lost)		All	1.2		V
I_{CCINTQ}	Quiescent V_{CCINT} supply current (Note 1)		XCV50E		200	mA
			XCV100E		200	mA
			XCV200E		300	mA
			XCV300E		300	mA
			XCV400E		300	mA
			XCV600E		400	mA
			XCV1000E		500	mA
			XCV1600E		500	mA
			XCV2000E		500	mA
			XCV2600E		500	mA
			XCV3200E		500	mA
I_{CCOQ}	Quiescent V_{CCO} supply current (Note 1)		XCV50E		2	mA
			XCV100E		2	mA
			XCV200E		2	mA
			XCV300E		2	mA
			XCV400E		2	mA
			XCV600E		2	mA
			XCV1000E		2	mA
			XCV1600E		2	mA
			XCV2000E		2	mA
			XCV2600E		2	mA
			XCV3200E		2	mA
I_L	Input or output leakage current		All	–10	+10	μA
C_{IN}	Input capacitance (sample tested)	BGA, PQ, HQ, packages	All		8	pF
I_{RPU}	Pad pull-up (when selected) @ V_{in} = 0 V, V_{CCO} = 3.3 V (sample tested)		All	Note 2	0.25	mA
I_{RPD}	Pad pull-down (when selected) @ V_{in} = 3.6 V (sample tested)			Note 2	0.25	mA

Notes:
1. With no output current loads, no active input pull-up resistors, all I/O pins 3-stated and floating.
2. Internal pull-up and pull-down resistors guarantee valid logic levels at unconnected input pins. These pull-up and pull-down resistors do not guarantee valid logic levels when input pins are connected to other circuits.

IOB Output Switching Characteristics Standard Adjustments

Output delays terminating at a pad are specified for LVTTL with 12 mA drive and fast slew rate. For other standards, adjust the delays by the values shown.

			Speed Grade				
Description	**Symbol**	**Standard**	**Min**	**-8**	**-7**	**-6**	**Units**
Output Delay Adjustments							
Standard-specific adjustments for output delays terminating at pads (based on standard capacitive load, Csl)	T_{OLVTTL_S2}	LVTTL, Slow, 2 mA	4.2	+14.7	+14.7	+14.7	ns

Notes:

1. Input timing for GPLVTTL is measured at 1.4 V. For other I/O standards, see Table 4.

Virtex-E Pin-to-Pin Input Parameter Guidelines

All devices are 100% functionally tested. Listed below are representative values for typical pin locations and normal clock loading. Values are expressed in nanoseconds unless otherwise noted

Global Clock Set-Up and Hold for LVTTL Standard, *with* DLL

Description(1)	Symbol	Device	Speed Grade(2, 3)				Units
			Min	-8	-7	-6	
Input Setup and Hold Time Relative to Global Clock Input Signal for LVTTL Standard. For data input with different standards, adjust the setup time delay by the values shown in **IOB Input Switching Characteristics Standard Adjustments**, page 8.							
No Delay	T_{PSDLL}/T_{PHDLL}	XCV50E	1.5 / –0.4	1.5 / –0.4	1.6 / –0.4	1.7 / –0.4	ns
Global Clock and IFF, with DLL		XCV100E	1.5 / –0.4	1.5 / –0.4	1.6 / –0.4	1.7 / –0.4	ns
		XCV200E	1.5 / –0.4	1.5 / –0.4	1.6 / –0.4	1.7 / –0.4	ns
		XCV300E	1.5 / –0.4	1.5 / –0.4	1.6 / –0.4	1.7 / –0.4	ns
		XCV400E	1.5 / –0.4	1.5 / –0.4	1.6 / –0.4	1.7 / –0.4	ns
		XCV600E	1.5 / –0.4	1.5 / –0.4	1.6 / –0.4	1.7 / –0.4	ns
		XCV1000E	1.5 / –0.4	1.5 / –0.4	1.6 / –0.4	1.7 / –0.4	ns
		XCV1600E	1.5 / –0.4	1.5 / –0.4	1.6 / –0.4	1.7 / –0.4	ns
		XCV2000E	1.5 / –0.4	1.5 / –0.4	1.6 / –0.4	1.7 / –0.4	ns
		XCV2600E	1.5 / –0.4	1.5 / –0.4	1.6 / –0.4	1.7 / –0.4	ns
		XCV3200E	1.5 / –0.4	1.5 / –0.4	1.6 / –0.4	1.7 / –0.4	ns

Notes:
1. IFF = Input Flip-Flop or Latch
2. Setup time is measured relative to the Global Clock input signal with the fastest route and the lightest load. Hold time is measured relative to the Global Clock input signal with the slowest route and heaviest load.
3. DLL output jitter is already included in the timing calculation.

Pinout Differences Between Virtex and Virtex-E Families

The same device in the same package for the Virtex-E and Virtex families are pin-compatible with some minor exceptions, listed in Table 1.

XCV200E Device, FG456 Package

The Virtex-E XCV200E has two I/O pins swapped with the Virtex XCV200 to accommodate differential clock pairing.

XCV400E Device, FG676 Package

The Virtex-E XCV400E has two I/O pins swapped with the Virtex XCV400 to accommodate differential clock pairing.

All Devices, PQ240 and HQ240 Packages

The Virtex devices in PQ240 and HQ240 packages do not have V_{CCO} banking, but Virtex-E devices do. To achieve this, eight Virtex I/O pins (P232, P207, P176, P146, P116, P85, P55, and P25) are now VCCO pins in the Virtex-E family. This change also requires one Virtex I/O or VREF pin to be swapped with a standard I/O pin.

Additionally, accommodating differential clock input pairs in Virtex-E caused some IO_V_{REF} differences in the XCV400E and XCV600E devices only. Virtex IO_V_{REF} pins P215 and P87 are Virtex-E IO_V_{REF} pins P216 and P86, respectively. Virtex-E pins P215 and P87 are IO_DLL.

Table 1: **Pinout Differences Summary**

Part	Package	Pins	Virtex	Virtex-E
XCV200	FG456	E11, U11	I/O	No Connect
		B11, AA11	No Connect	IO_LVDS_DLL
XCV400	FG676	D13, Y13	I/O	No Connect
		B13, AF13	No Connect	IO_LVDS_DLL
XCV400/600	PQ240/HQ240	P215, P87	IO_V_{REF}	IO_LVDS_DLL
		P216, P86	I/O	IO_V_{REF}
All	PQ240/HQ240	P232, P207, P176, P146, P116, P85, P55, and P25	I/O	V_{CCO}
		P231	I/O	IO_V_{REF}

FG1156 Differential Pin Pairs

Virtex-E devices have differential pin pairs that can also provide other functions when not used as a differential pair. The AO column in Table 29 indicates which devices in this package can use the pin pair as an asynchronous output. The “Other Functions” column indicates alternative function(s) that are not available when the pair is used as a differential pair or differential clock.

Table 29: **FG1156 Differential Pin Pair Summary: XCV1000E, XCV1600E, XCV2000E, XCV2600E, XCV3200E**
