

Welcome to [E-XFL.COM](#)

### **Understanding Embedded - FPGAs (Field Programmable Gate Array)**

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

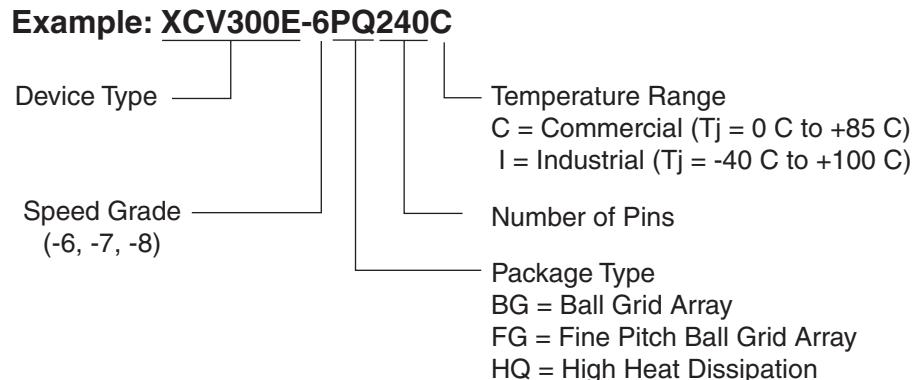

### **Applications of Embedded - FPGAs**

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

#### **Details**

Product Status	Obsolete
Number of LABs/CLBs	600
Number of Logic Elements/Cells	2700
Total RAM Bits	81920
Number of I/O	94
Number of Gates	128236
Voltage - Supply	1.71V ~ 1.89V
Mounting Type	Surface Mount
Operating Temperature	0°C ~ 85°C (TJ)
Package / Case	144-TFBGA, CSPBGA
Supplier Device Package	144-LCSBGA (12x12)
Purchase URL	<a href="https://www.e-xfl.com/product-detail/xilinx/xcv100e-8cs144c">https://www.e-xfl.com/product-detail/xilinx/xcv100e-8cs144c</a>

## Virtex-E Ordering Information

DS022\_043\_072000

Figure 1: Ordering Information

## Revision History

The following table shows the revision history for this document.

Date	Version	Revision
12/7/99	1.0	Initial Xilinx release.
1/10/00	1.1	Re-released with spd.txt v. 1.18, FG860/900/1156 package information, and additional DLL, Select RAM and SelectI/O information.
1/28/00	1.2	Added Delay Measurement Methodology table, updated SelectI/O section, Figures 30, 54, & 55, text explaining Table 5, $T_{BYP}$ values, buffered Hex Line info, p. 8, I/O Timing Measurement notes, notes for Tables 15, 16, and corrected F1156 pinout table footnote references.
2/29/00	1.3	Updated pinout tables, $V_{CC}$ page 20, and corrected Figure 20.
5/23/00	1.4	Correction to table on p. 22.
7/10/00	1.5	<ul style="list-style-type: none"> <li>• Numerous minor edits.</li> <li>• Data sheet upgraded to Preliminary.</li> <li>• Preview -8 numbers added to <b>Virtex-E Electrical Characteristics</b> tables.</li> </ul>
8/1/00	1.6	<ul style="list-style-type: none"> <li>• Reformatted entire document to follow new style guidelines.</li> <li>• Changed speed grade values in tables on pages 35-37.</li> </ul>
9/20/00	1.7	<ul style="list-style-type: none"> <li>• Min values added to <b>Virtex-E Electrical Characteristics</b> tables.</li> <li>• XCV2600E and XCV3200E numbers added to <b>Virtex-E Electrical Characteristics</b> tables (Module 3).</li> <li>• Corrected user I/O count for XCV100E device in Table 1 (Module 1).</li> <li>• Changed several pins to "No Connect in the XCV100E" and removed duplicate <math>V_{CCINT}</math> pins in Table ~ (Module 4).</li> <li>• Changed pin J10 to "No connect in XCV600E" in Table 74 (Module 4).</li> <li>• Changed pin J30 to "VREF option only in the XCV600E" in Table 74 (Module 4).</li> <li>• Corrected pair 18 in Table 75 (Module 4) to be "AO in the XCV1000E, XCV1600E".</li> </ul>

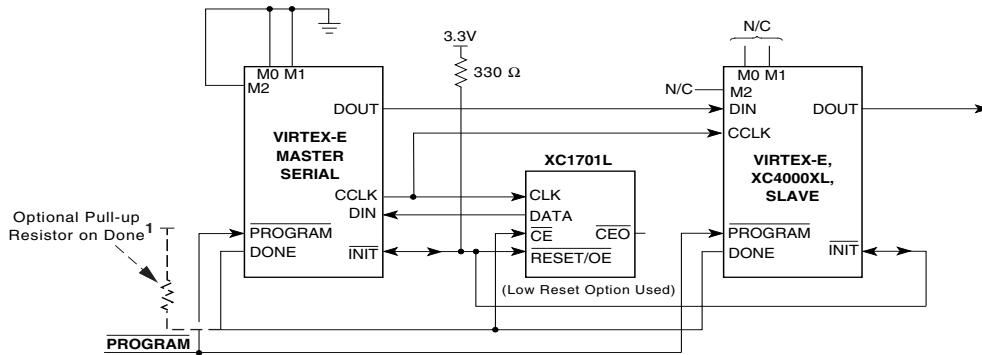

Figure 13: Master/Slave Serial Mode Circuit Diagram

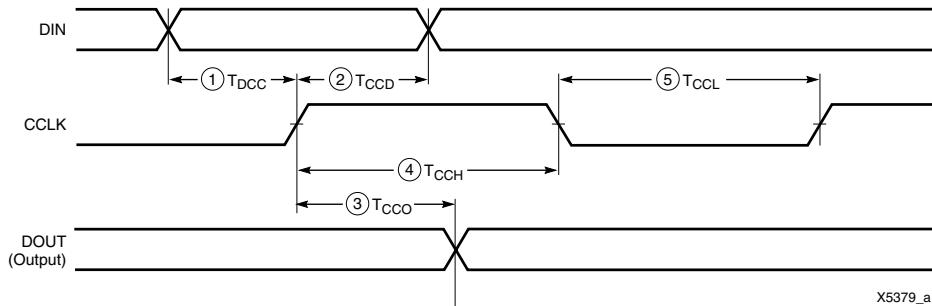

Figure 14: Slave-Serial Mode Programming Switching Characteristics

### Master-Serial Mode

In master-serial mode, the CCLK output of the FPGA drives a Xilinx Serial PROM that feeds bit-serial data to the DIN input. The FPGA accepts this data on each rising CCLK edge. After the FPGA has been loaded, the data for the next device in a daisy-chain is presented on the DOUT pin after the rising CCLK edge. The maximum capacity for a single LOUT/DOUT write is  $2^{20}-1$  (1,048,575) 32-bit words, or 33,554,4000 bits.

The interface is identical to slave-serial except that an internal oscillator is used to generate the configuration clock (CCLK). A wide range of frequencies can be selected for CCLK, which always starts at a slow default frequency. Configuration bits then switch CCLK to a higher frequency for the remainder of the configuration. Switching to a lower frequency is prohibited.

The CCLK frequency is set using the ConfigRate option in the bitstream generation software. The maximum CCLK fre-

quency that can be selected is 60 MHz. When selecting a CCLK frequency, ensure that the serial PROM and any daisy-chained FPGAs are fast enough to support the clock rate.

On power-up, the CCLK frequency is approximately 2.5 MHz. This frequency is used until the ConfigRate bits have been loaded when the frequency changes to the selected ConfigRate. Unless a different frequency is specified in the design, the default ConfigRate is 4 MHz.

In a full master/slave system (Figure 13), the left-most device operates in master-serial mode. The remaining devices operate in slave-serial mode. The SPROM RESET pin is driven by INIT, and the CE input is driven by DONE. There is the potential for contention on the DONE pin, depending on the start-up sequence options chosen.

The sequence of operations necessary to configure a Virtex-E FPGA serially appears in Figure 15.

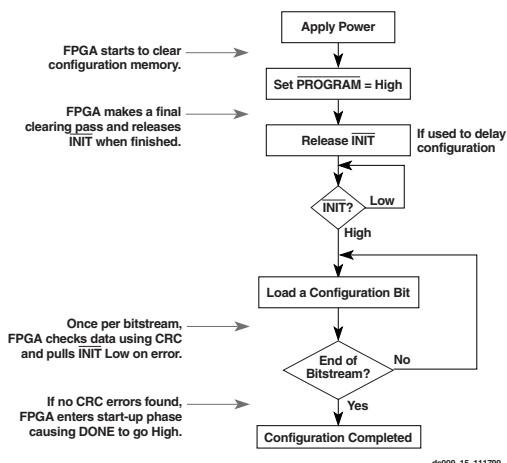

Figure 15: Serial Configuration Flowchart

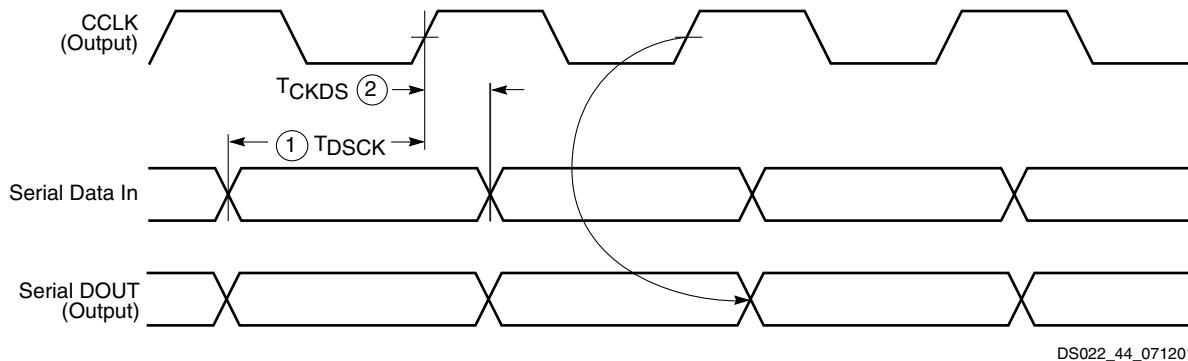

Figure 16: Master-Serial Mode Programming Switching Characteristics

At power-up,  $V_{CC}$  must rise from 1.0 V to  $V_{CC}$  Min in less than 50 ms, otherwise delay configuration by pulling PROGRAM Low until  $V_{CC}$  is valid.

### SelectMAP Mode

The SelectMAP mode is the fastest configuration option. Byte-wide data is written into the FPGA with a BUSY flag controlling the flow of data.

An external data source provides a byte stream, CCLK, a Chip Select ( $\overline{CS}$ ) signal and a Write signal ( $\overline{WRITE}$ ). If BUSY is asserted (High) by the FPGA, the data must be held until BUSY goes Low.

Data can also be read using the SelectMAP mode. If  $\overline{WRITE}$  is not asserted, configuration data is read out of the FPGA as part of a readback operation.

After configuration, the pins of the SelectMAP port can be used as additional user I/O. Alternatively, the port can be retained to permit high-speed 8-bit readback.

Retention of the SelectMAP port is selectable on a design-by-design basis when the bitstream is generated. If retention is selected, PROHIBIT constraints are required to prevent the SelectMAP-port pins from being used as user I/O.

Figure 16 shows the timing of master-serial configuration. Master-serial mode is selected by a <000> or <100> on the mode pins (M2, M1, M0). Table 10 shows the timing information for Figure 16.

Multiple Virtex-E FPGAs can be configured using the SelectMAP mode, and be made to start-up simultaneously. To configure multiple devices in this way, wire the individual CCLK, Data,  $\overline{WRITE}$ , and BUSY pins of all the devices in parallel. The individual devices are loaded separately by asserting the  $\overline{CS}$  pin of each device in turn and writing the appropriate data. See Table 11 for SelectMAP Write Timing Characteristics.

### Write

Write operations send packets of configuration data into the FPGA. The sequence of operations for a multi-cycle write operation is shown below. Note that a configuration packet can be split into many such sequences. The packet does not have to complete within one assertion of  $\overline{CS}$ , illustrated in Figure 17.

1. Assert  $\overline{WRITE}$  and  $\overline{CS}$  Low. Note that when  $\overline{CS}$  is asserted on successive CCLKs,  $\overline{WRITE}$  must remain either asserted or de-asserted. Otherwise, an abort is initiated, as described below.
2. Drive data onto D[7:0]. Note that to avoid contention, the data source should not be enabled while  $\overline{CS}$  is Low and  $\overline{WRITE}$  is High. Similarly, while  $\overline{WRITE}$  is High, no more than one  $\overline{CS}$  should be asserted.

## DLL Properties

Properties provide access to some of the Virtex-E series DLL features, (for example, clock division and duty cycle correction).

### Duty Cycle Correction Property

The 1x clock outputs, CLK0, CLK90, CLK180, and CLK270, use the duty-cycle corrected default, exhibiting a 50/50 duty cycle. The DUTY\_CYCLE\_CORRECTION property (by default TRUE) controls this feature. To deactivate the DLL duty-cycle correction for the 1x clock outputs, attach the DUTY\_CYCLE\_CORRECTION=FALSE property to the DLL symbol.

### Clock Divide Property

The CLKDV\_DIVIDE property specifies how the signal on the CLKDV pin is frequency divided with respect to the CLK0 pin. The values allowed for this property are 1.5, 2, 2.5, 3, 4, 5, 8, or 16; the default value is 2.

### Startup Delay Property

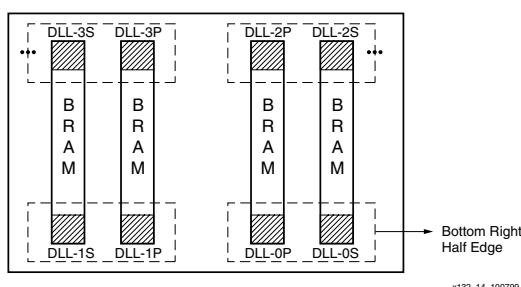

This property, STARTUP\_WAIT, takes on a value of TRUE or FALSE (the default value). When TRUE the device configuration DONE signal waits until the DLL locks before going to High.

### Virtex-E DLL Location Constraints

As shown in [Figure 26](#), there are four additional DLLs in the Virtex-E devices, for a total of eight per Virtex-E device. These DLLs are located in silicon, at the top and bottom of the two innermost block SelectRAM columns. The location constraint LOC, attached to the DLL symbol with the identifier DLL0S, DLL0P, DLL1S, DLL1P, DLL2S, DLL2P, DLL3S, or DLL3P, controls the DLL location.

The LOC property uses the following form:

LOC = DLL0P

*Figure 26: Virtex Series DLLs*

## Design Factors

Use the following design considerations to avoid pitfalls and improve success designing with Xilinx devices.

## Input Clock

The output clock signal of a DLL, essentially a delayed version of the input clock signal, reflects any instability on the input clock in the output waveform. For this reason the quality of the DLL input clock relates directly to the quality of the output clock waveforms generated by the DLL. The DLL input clock requirements are specified in the data sheet.

In most systems a crystal oscillator generates the system clock. The DLL can be used with any commercially available quartz crystal oscillator. For example, most crystal oscillators produce an output waveform with a frequency tolerance of 100 PPM, meaning 0.01 percent change in the clock period. The DLL operates reliably on an input waveform with a frequency drift of up to 1 ns — orders of magnitude in excess of that needed to support any crystal oscillator in the industry. However, the cycle-to-cycle jitter must be kept to less than 300 ps in the low frequencies and 150 ps for the high frequencies.

### Input Clock Changes

Changing the period of the input clock beyond the maximum drift amount requires a manual reset of the CLKDLL. Failure to reset the DLL produces an unreliable lock signal and output clock.

It is possible to stop the input clock with little impact to the DLL. Stopping the clock should be limited to less than 100  $\mu$ s to keep device cooling to a minimum. The clock should be stopped during a Low phase, and when restored the full High period should be seen. During this time, LOCKED stays High and remains High when the clock is restored.

When the clock is stopped, one to four more clocks are still observed as the delay line is flushed. When the clock is restarted, the output clocks are not observed for one to four clocks as the delay line is filled. The most common case is two or three clocks.

In a similar manner, a phase shift of the input clock is also possible. The phase shift propagates to the output one to four clocks after the original shift, with no disruption to the CLKDLL control.

### Output Clocks

As mentioned earlier in the DLL pin descriptions, some restrictions apply regarding the connectivity of the output pins. The DLL clock outputs can drive an OBUF, a global clock buffer BUFG, or they can route directly to destination clock pins. The only BUFGs that the DLL clock outputs can drive are the two on the same edge of the device (top or bottom). In addition, the CLK2X output of the secondary DLL can connect directly to the CLKIN of the primary DLL in the same quadrant.

Do not use the DLL output clock signals until after activation of the LOCKED signal. Prior to the activation of the LOCKED signal, the DLL output clocks are not valid and can exhibit glitches, spikes, or other spurious movement.

**LVTTL**

LVTTL requires no termination. DC voltage specifications appears in [Table 34](#).

**Table 34: LVTTL Voltage Specifications**

Parameter	Min	Typ	Max
$V_{CCO}$	3.0	3.3	3.6
$V_{REF}$	-	-	-
$V_{TT}$	-	-	-
$V_{IH}$	2.0	-	3.6
$V_{IL}$	-0.5	-	0.8
$V_{OH}$	2.4	-	-
$V_{OL}$	-	-	0.4
$I_{OH}$ at $V_{OH}$ (mA)	-24	-	-
$I_{OL}$ at $V_{OL}$ (mA)	24	-	-

**Notes:**

1. Note:  $V_{OL}$  and  $V_{OH}$  for lower drive currents sample tested.

**LVCMOS2**

LVCMOS2 requires no termination. DC voltage specifications appear in [Table 35](#).

**Table 35: LVCMOS2 Voltage Specifications**

Parameter	Min	Typ	Max
$V_{CCO}$	2.3	2.5	2.7
$V_{REF}$	-	-	-
$V_{TT}$	-	-	-
$V_{IH}$	1.7	-	3.6
$V_{IL}$	-0.5	-	0.7
$V_{OH}$	1.9	-	-
$V_{OL}$	-	-	0.4
$I_{OH}$ at $V_{OH}$ (mA)	-12	-	-
$I_{OL}$ at $V_{OL}$ (mA)	12	-	-

**LVCMOS18**

LVCMOS18 does not require termination. [Table 36](#) lists DC voltage specifications.

**Table 36: LVCMOS18 Voltage Specifications**

Parameter	Min	Typ	Max
$V_{CCO}$	1.70	1.80	1.90
$V_{REF}$	-	-	-
$V_{TT}$	-	-	-
$V_{IH}$	$0.65 \times V_{CCO}$	-	1.95
$V_{IL}$	-0.5	-	$0.2 \times V_{CCO}$
$V_{OH}$	$V_{CCO} - 0.4$	-	-
$V_{OL}$	-	-	0.4
$I_{OH}$ at $V_{OH}$ (mA)	-8	-	-
$I_{OL}$ at $V_{OL}$ (mA)	8	-	-

**AGP-2X**

The specification for the AGP-2X standard does not document a recommended termination technique. DC voltage specifications appear in [Table 37](#).

**Table 37: AGP-2X Voltage Specifications**

Parameter	Min	Typ	Max
$V_{CCO}$	3.0	3.3	3.6
$V_{REF} = N \times V_{CCO}^{(1)}$	1.17	1.32	1.48
$V_{TT}$	-	-	-
$V_{IH} = V_{REF} + 0.2$	1.37	1.52	-
$V_{IL} = V_{REF} - 0.2$	-	1.12	1.28
$V_{OH} = 0.9 \times V_{CCO}$	2.7	3.0	-
$V_{OL} = 0.1 \times V_{CCO}$	-	0.33	0.36
$I_{OH}$ at $V_{OH}$ (mA)	Note 2	-	-
$I_{OL}$ at $V_{OL}$ (mA)	Note 2	-	-

**Notes:**

1. N must be greater than or equal to 0.39 and less than or equal to 0.41.
2. Tested according to the relevant specification.

	T <sub>GPAGP</sub>	AGP	0.21	0.27	0.27	0.27	ns, max

**Notes:**

1. Input timing for GPLVTTL is measured at 1.4 V. For other I/O standards, see Table 4.

## PQ240 Differential Pin Pairs

Virtex-E devices have differential pin pairs that can also provide other functions when not used as a differential pair. A √ in the AO column indicates that the pin pair can be used as an asynchronous output for all devices provided in this package. Pairs with a note number in the AO column are device dependent. They can have asynchronous outputs if the pin pair are in the same CLB row and column in the device. Numbers in this column refer to footnotes that indicate which devices have pin pairs than can be asynchronous outputs. The Other Functions column indicates alternative function(s) not available when the pair is used as a differential pair or differential clock.

## BG352 Differential Pin Pairs

Virtex-E devices have differential pin pairs that can also provide other functions when not used as a differential pair. A check (✓) in the AO column indicates that the pin pair can be used as an asynchronous output for all devices provided in this package. Pairs with a note number in the AO column are device dependent. They can have asynchronous outputs if the pin pair are in the same CLB row and column in the device. Numbers in this column refer to footnotes that indicate which devices have pin pairs than can be asynchronous outputs. The Other Functions column indicates alternative function(s) not available when the pair is used as a differential pair or differential clock.

**FG1156 Fine-Pitch Ball Grid Array Package**

XCV1000E, XCV1600E, XCV2000E, XCV2600E, and XCV3200E devices in the FG1156 fine-pitch Ball Grid Array package have footprint compatibility. Pins labeled IO\_VREF can be used as either  $V_{REF}$  or general I/O, unless indicated in the footnotes. If the pin is not used as  $V_{REF}$  it can be used as general I/O. Immediately following Table 28, see Table 29 for Differential Pair information.
