Welcome to E-XFL.COM

Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

Details	
Product Status	Obsolete
Number of LABs/CLBs	7776
Number of Logic Elements/Cells	34992
Total RAM Bits	589824
Number of I/O	660
Number of Gates	2188742
Voltage - Supply	1.71V ~ 1.89V
Mounting Type	Surface Mount
Operating Temperature	0°C ~ 85°C (TJ)
Package / Case	860-BGA Exposed Pad
Supplier Device Package	860-FBGA (42.5x42.5)
Purchase URL	https://www.e-xfl.com/product-detail/xilinx/xcv1600e-8fg860c

resources. The abundance of routing resources permits the Virtex-E family to accommodate even the largest and most complex designs.

Virtex-E FPGAs are SRAM-based, and are customized by loading configuration data into internal memory cells. Configuration data can be read from an external SPROM (master serial mode), or can be written into the FPGA (SelectMAP™, slave serial, and JTAG modes).

The standard Xilinx Foundation Series™ and Alliance Series™ Development systems deliver complete design support for Virtex-E, covering every aspect from behavioral and schematic entry, through simulation, automatic design translation and implementation, to the creation and downloading of a configuration bit stream.

Higher Performance

Virtex-E devices provide better performance than previous generations of FPGAs. Designs can achieve synchronous system clock rates up to 240 MHz including I/O or 622 Mb/s using Source Synchronous data transmission architectures. Virtex-E I/Os comply fully with 3.3 V PCI specifications, and interfaces can be implemented that operate at 33 MHz or 66 MHz.

While performance is design-dependent, many designs operate internally at speeds in excess of 133 MHz and can achieve over 311 MHz. Table 2 shows performance data for representative circuits, using worst-case timing parameters.

Table 2: **Performance for Common Circuit Functions**

Function	Bits	Virtex-E (-7)
Register-to-Register		
Adder	16 64	4.3 ns 6.3 ns
Pipelined Multiplier	8 x 8 16 x 16	4.4 ns 5.1 ns
Address Decoder	16 64	3.8 ns 5.5 ns

Virtex-E Ordering Information

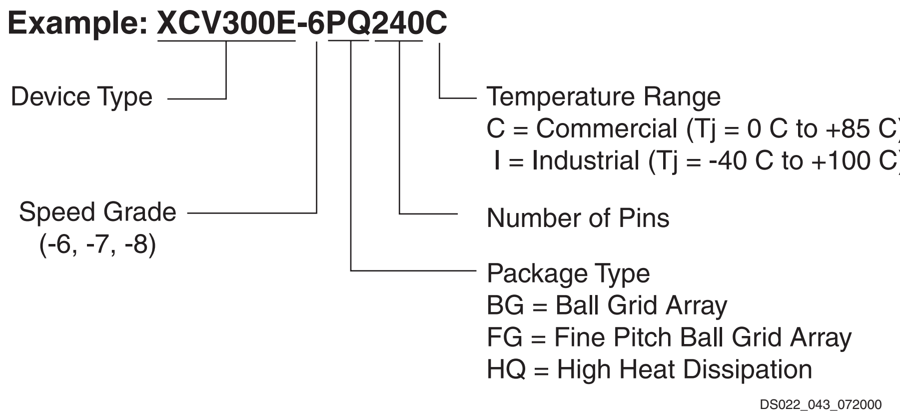

Figure 1: **Ordering Information**

Revision History

The following table shows the revision history for this document.

Date	Version	Revision
12/7/99	1.0	Initial Xilinx release.
1/10/00	1.1	Re-released with spd.txt v. 1.18, FG860/900/1156 package information, and additional DLL, Select RAM and SelectI/O information.
1/28/00	1.2	Added Delay Measurement Methodology table, updated SelectI/O section, Figures 30, 54, & 55, text explaining Table 5, T_{BYP} values, buffered Hex Line info, p. 8, I/O Timing Measurement notes, notes for Tables 15, 16, and corrected F1156 pinout table footnote references.
2/29/00	1.3	Updated pinout tables, V_{CC} page 20, and corrected Figure 20.
5/23/00	1.4	Correction to table on p. 22.
7/10/00	1.5	• Numerous minor edits. • Data sheet upgraded to Preliminary. • Preview -8 numbers added to **Virtex-E Electrical Characteristics** tables.
8/1/00	1.6	• Reformatted entire document to follow new style guidelines. • Changed speed grade values in tables on pages 35-37.
9/20/00	1.7	• Min values added to **Virtex-E Electrical Characteristics** tables. • XCV2600E and XCV3200E numbers added to **Virtex-E Electrical Characteristics** tables (Module 3). • Corrected user I/O count for XCV100E device in Table 1 (Module 1). • Changed several pins to “No Connect in the XCV100E“ and removed duplicate V_{CCINT} pins in Table ~ (Module 4). • Changed pin J10 to “No connect in XCV600E” in Table 74 (Module 4). • Changed pin J30 to “VREF option only in the XCV600E” in Table 74 (Module 4). • Corrected pair 18 in Table 75 (Module 4) to be “AO in the XCV1000E, XCV1600E“.

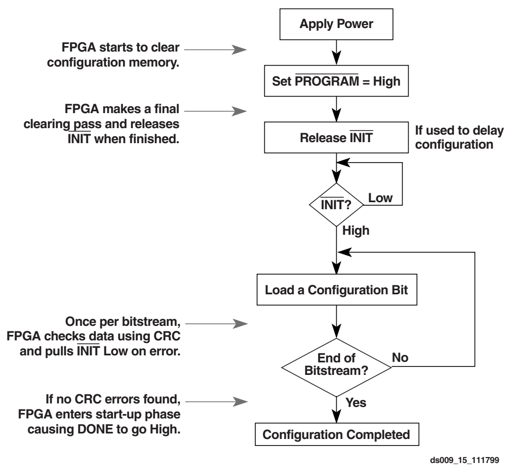

Figure 15: **Serial Configuration Flowchart**

Figure 16 shows the timing of master-serial configuration. Master-serial mode is selected by a <000> or <100> on the mode pins (M2, M1, M0). Table 10 shows the timing information for Figure 16.

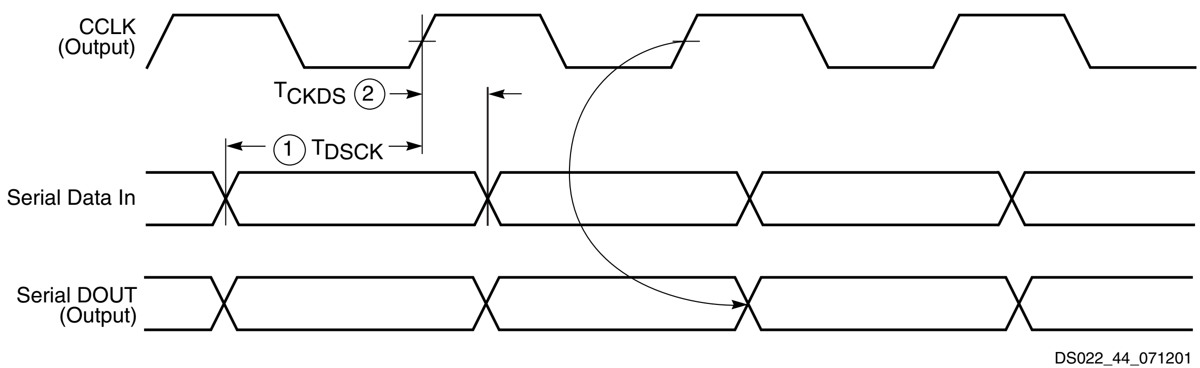

Figure 16: **Master-Serial Mode Programming Switching Characteristics**

At power-up, V_{CC} must rise from 1.0 V to V_{CC} Min in less than 50 ms, otherwise delay configuration by pulling $\overline{\text{PROGRAM}}$ Low until V_{CC} is valid.

SelectMAP Mode

The SelectMAP mode is the fastest configuration option. Byte-wide data is written into the FPGA with a BUSY flag controlling the flow of data.

An external data source provides a byte stream, CCLK, a Chip Select ($\overline{\text{CS}}$) signal and a Write signal ($\overline{\text{WRITE}}$). If BUSY is asserted (High) by the FPGA, the data must be held until BUSY goes Low.

Data can also be read using the SelectMAP mode. If $\overline{\text{WRITE}}$ is not asserted, configuration data is read out of the FPGA as part of a readback operation.

After configuration, the pins of the SelectMAP port can be used as additional user I/O. Alternatively, the port can be retained to permit high-speed 8-bit readback.

Retention of the SelectMAP port is selectable on a design-by-design basis when the bitstream is generated. If retention is selected, PROHIBIT constraints are required to prevent the SelectMAP-port pins from being used as user I/O.

Multiple Virtex-E FPGAs can be configured using the SelectMAP mode, and be made to start-up simultaneously. To configure multiple devices in this way, wire the individual CCLK, Data, $\overline{\text{WRITE}}$, and BUSY pins of all the devices in parallel. The individual devices are loaded separately by asserting the $\overline{\text{CS}}$ pin of each device in turn and writing the appropriate data. See Table 11 for SelectMAP Write Timing Characteristics.

Write

Write operations send packets of configuration data into the FPGA. The sequence of operations for a multi-cycle write operation is shown below. Note that a configuration packet can be split into many such sequences. The packet does not have to complete within one assertion of $\overline{\text{CS}}$, illustrated in Figure 17.

1. Assert $\overline{\text{WRITE}}$ and $\overline{\text{CS}}$ Low. Note that when $\overline{\text{CS}}$ is asserted on successive CCLKs, $\overline{\text{WRITE}}$ must remain either asserted or de-asserted. Otherwise, an abort is initiated, as described below.
2. Drive data onto D[7:0]. Note that to avoid contention, the data source should not be enabled while $\overline{\text{CS}}$ is Low and $\overline{\text{WRITE}}$ is High. Similarly, while $\overline{\text{WRITE}}$ is High, no more that one $\overline{\text{CS}}$ should be asserted.

3. At the rising edge of CCLK: If BUSY is Low, the data is accepted on this clock. If BUSY is High (from a previous write), the data is not accepted. Acceptance instead occurs on the first clock after BUSY goes Low, and the data must be held until this has happened.
4. Repeat steps 2 and 3 until all the data has been sent.
5. De-assert $\overline{\text{CS}}$ and $\overline{\text{WRITE}}$.

Table 11: **SelectMAP Write Timing Characteristics**

	Description		Symbol		Units
CCLK	$D_{0\text{-}7}$ Setup/Hold	1/2	T_{SMDCC}/T_{SMCCD}	5.0 / 1.7	ns, min
	$\overline{\text{CS}}$ Setup/Hold	3/4	T_{SMCSCC}/T_{SMCCCS}	7.0 / 1.7	ns, min
	$\overline{\text{WRITE}}$ Setup/Hold	5/6	T_{SMCCW}/T_{SMWCC}	7.0 / 1.7	ns, min
	BUSY Propagation Delay	7	T_{SMCKBY}	12.0	ns, max
	Maximum Frequency		F_{CC}	66	MHz, max
	Maximum Frequency with no handshake		F_{CCNH}	50	MHz, max

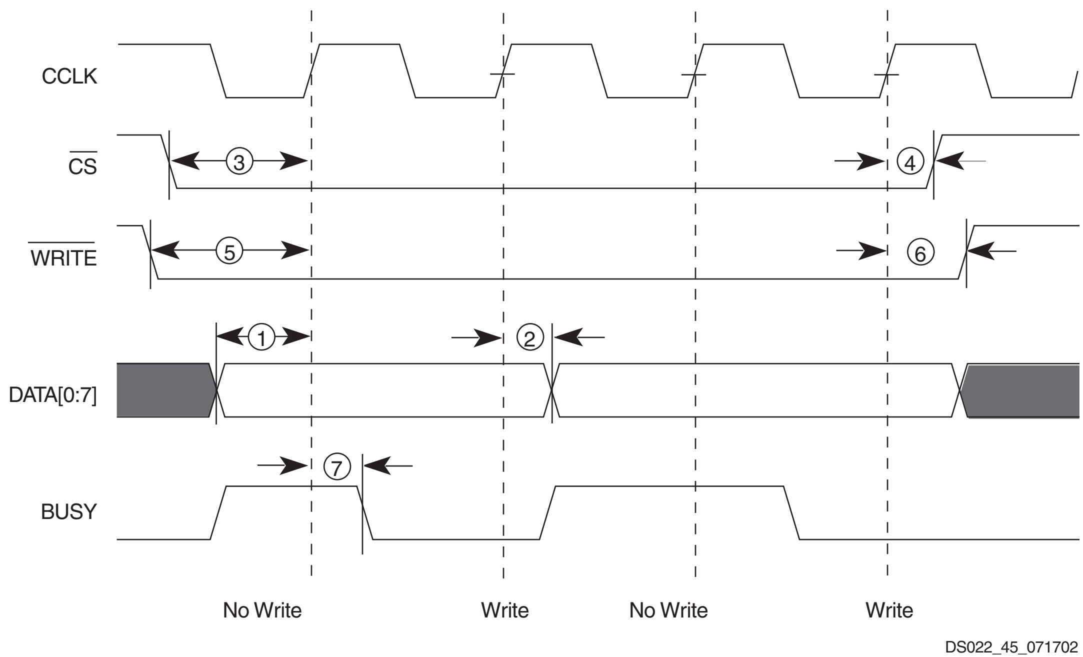

Figure 17: **Write Operations**

A flowchart for the write operation is shown in Figure 18. Note that if CCLK is slower than f_{CCNH}, the FPGA never asserts BUSY, In this case, the above handshake is unnecessary, and data can simply be entered into the FPGA every CCLK cycle.

Abort

During a given assertion of $\overline{\text{CS}}$, the user cannot switch from a write to a read, or vice-versa. This action causes the current packet command to be aborted. The device remains BUSY until the aborted operation has completed. Following an abort, data is assumed to be unaligned to word boundaries, and the FPGA requires a new synchronization word prior to accepting any new packets.

To initiate an abort during a write operation, de-assert $\overline{\text{WRITE}}$. At the rising edge of CCLK, an abort is initiated, as shown in Figure 19.

the internal storage elements to begin changing state in response to the logic and the user clock.

The relative timing of these events can be changed. In addition, the GTS, GSR, and GWE events can be made dependent on the DONE pins of multiple devices all going High, forcing the devices to start synchronously. The sequence can also be paused at any stage until lock has been achieved on any or all DLLs.

Readback

The configuration data stored in the Virtex-E configuration memory can be readback for verification. Along with the configuration data it is possible to readback the contents all flip-flops/latches, LUT RAMs, and block RAMs. This capability is used for real-time debugging. For more detailed information, see application note XAPP138 "Virtex FPGA Series Configuration and Readback".

Design Considerations

This section contains more detailed design information on the following features.

- Delay-Locked Loop . . . see page 19
- BlockRAM . . . see page 24
- SelectI/O . . . see page 31

Using DLLs

The Virtex-E FPGA series provides up to eight fully digital dedicated on-chip Delay-Locked Loop (DLL) circuits which provide zero propagation delay, low clock skew between output clock signals distributed throughout the device, and advanced clock domain control. These dedicated DLLs can be used to implement several circuits which improve and simplify system level design.

Introduction

As FPGAs grow in size, quality on-chip clock distribution becomes increasingly important. Clock skew and clock delay impact device performance and the task of managing clock skew and clock delay with conventional clock trees becomes more difficult in large devices. The Virtex-E series of devices resolve this potential problem by providing up to eight fully digital dedicated on-chip DLL circuits, which provide zero propagation delay and low clock skew between output clock signals distributed throughout the device.

Each DLL can drive up to two global clock routing networks within the device. The global clock distribution network minimizes clock skews due to loading differences. By monitoring a sample of the DLL output clock, the DLL can compensate for the delay on the routing network, effectively eliminating the delay from the external input port to the individual clock loads within the device.

In addition to providing zero delay with respect to a user source clock, the DLL can provide multiple phases of the source clock. The DLL can also act as a clock doubler or it can divide the user source clock by up to 16.

Clock multiplication gives the designer a number of design alternatives. For instance, a 50 MHz source clock doubled by the DLL can drive an FPGA design operating at 100 MHz. This technique can simplify board design because the clock path on the board no longer distributes such a high-speed signal. A multiplied clock also provides designers the option of time-domain-multiplexing, using one circuit twice per clock cycle, consuming less area than two copies of the same circuit. Two DLLs in can be connected in series to increase the effective clock multiplication factor to four.

The DLL can also act as a clock mirror. By driving the DLL output off-chip and then back in again, the DLL can be used to deskew a board level clock between multiple devices.

In order to guarantee the system clock establishes prior to the device "waking up," the DLL can delay the completion of the device configuration process until after the DLL achieves lock.

By taking advantage of the DLL to remove on-chip clock delay, the designer can greatly simplify and improve system level design involving high-fanout, high-performance clocks.

Library DLL Symbols

Figure 21 shows the simplified Xilinx library DLL macro symbol, BUFGDLL. This macro delivers a quick and efficient way to provide a system clock with zero propagation delay throughout the device. Figure 22 and Figure 23 show the two library DLL primitives. These symbols provide access to the complete set of DLL features when implementing more complex applications.

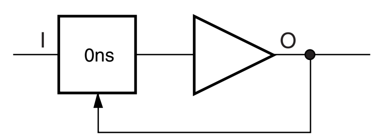

Figure 21: **Simplified DLL Macro Symbol BUFGDLL**

Fundamentals

Modern bus applications, pioneered by the largest and most influential companies in the digital electronics industry, are commonly introduced with a new I/O standard tailored specifically to the needs of that application. The bus I/O standards provide specifications to other vendors who create products designed to interface with these applications. Each standard often has its own specifications for current, voltage, I/O buffering, and termination techniques.

The ability to provide the flexibility and time-to-market advantages of programmable logic is increasingly dependent on the capability of the programmable logic device to support an ever increasing variety of I/O standards

The SelectI/O resources feature highly configurable input and output buffers which provide support for a wide variety of I/O standards. As shown in Table 18, each buffer type can support a variety of voltage requirements.

Table 18: **Virtex-E Supported I/O Standards**

I/O Standard	Output V_{CCO}	Input V_{CCO}	Input V_{REF}	Board Termination Voltage (V_{TT})
LVTTL	3.3	3.3	N/A	N/A
LVCMOS2	2.5	2.5	N/A	N/A
LVCMOS18	1.8	1.8	N/A	N/A
SSTL3 I & II	3.3	N/A	1.50	1.50
SSTL2 I & II	2.5	N/A	1.25	1.25
GTL	N/A	N/A	0.80	1.20
GTL+	N/A	N/A	1.0	1.50
HSTL I	1.5	N/A	0.75	0.75
HSTL III & IV	1.5	N/A	0.90	1.50
CTT	3.3	N/A	1.50	1.50
AGP-2X	3.3	N/A	1.32	N/A
PCI33_3	3.3	3.3	N/A	N/A
PCI66_3	3.3	3.3	N/A	N/A
BLVDS & LVDS	2.5	N/A	N/A	N/A
LVPECL	3.3	N/A	N/A	N/A

Overview of Supported I/O Standards

This section provides a brief overview of the I/O standards supported by all Virtex-E devices.

While most I/O standards specify a range of allowed voltages, this document records typical voltage values only. Detailed information on each specification can be found on the Electronic Industry Alliance Jedec website at:

http://www.jedec.org

LVTTL — Low-Voltage TTL

The Low-Voltage TTL, or LVTTL standard is a general purpose EIA/JESDSA standard for 3.3V applications that uses an LVTTL input buffer and a Push-Pull output buffer. This standard requires a 3.3V output source voltage (V_{CCO}), but does not require the use of a reference voltage (V_{REF}) or a termination voltage (V_{TT}).

LVCMOS2 — Low-Voltage CMOS for 2.5 Volts

The Low-Voltage CMOS for 2.5 Volts or lower, or LVCMOS2 standard is an extension of the LVCMOS standard (JESD 8.-5) used for general purpose 2.5V applications. This standard requires a 2.5V output source voltage (V_{CCO}), but does not require the use of a reference voltage (V_{REF}) or a board termination voltage (V_{TT}).

LVCMOS18 — 1.8 V Low Voltage CMOS

This standard is an extension of the LVCMOS standard. It is used in general purpose 1.8 V applications. The use of a reference voltage (V_{REF}) or a board termination voltage (V_{TT}) is not required.

PCI — Peripheral Component Interface

The Peripheral Component Interface, or PCI standard specifies support for both 33 MHz and 66 MHz PCI bus applications. It uses a LVTTL input buffer and a Push-Pull output buffer. This standard does not require the use of a reference voltage (V_{REF}) or a board termination voltage (V_{TT}), however, it does require a 3.3V output source voltage (V_{CCO}).

GTL — Gunning Transceiver Logic Terminated

The Gunning Transceiver Logic, or GTL standard is a high-speed bus standard (JESD8.3) invented by Xerox. Xilinx has implemented the terminated variation for this standard. This standard requires a differential amplifier input buffer and a Open Drain output buffer.

GTL+ — Gunning Transceiver Logic Plus

The Gunning Transceiver Logic Plus, or GTL+ standard is a high-speed bus standard (JESD8.3) first used by the Pentium Pro processor.

HSTL — High-Speed Transceiver Logic

The High-Speed Transceiver Logic, or HSTL standard is a general purpose high-speed, 1.5V bus standard sponsored by IBM (EIA/JESD 8-6). This standard has four variations or classes. SelectI/O devices support Class I, III, and IV. This

HSTL

A sample circuit illustrating a valid termination technique for HSTL_I appears in Figure 46. A sample circuit illustrating a valid termination technique for HSTL_III appears in Figure 47.

Table 25: **HSTL Class I Voltage Specification**

Parameter	Min	Typ	Max
V_{CCO}	1.40	1.50	1.60
V_{REF}	0.68	0.75	0.90
V_{TT}	-	$V_{CCO} \times 0.5$	-
V_{IH}	$V_{REF} + 0.1$	-	-
V_{IL}	-	-	$V_{REF} - 0.1$
V_{OH}	$V_{CCO} - 0.4$	-	-
V_{OL}			0.4
I_{OH} at V_{OH} (mA)	–8	-	-
I_{OL} at V_{OL} (mA)	8	-	-

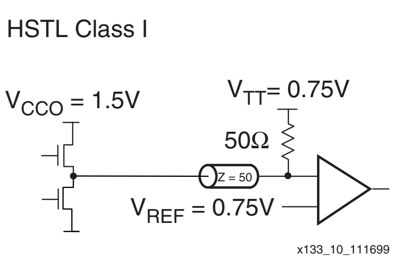

Figure 46: **Terminated HSTL Class I**

Table 26: **HSTL Class III Voltage Specification**

Parameter	Min	Typ	Max
V_{CCO}	1.40	1.50	1.60
V_{REF} (1)	-	0.90	-
V_{TT}	-	V_{CCO}	-
V_{IH}	$V_{REF} + 0.1$	-	-
V_{IL}	-	-	$V_{REF} - 0.1$
V_{OH}	$V_{CCO} - 0.4$	-	-
V_{OL}	-	-	0.4
I_{OH} at V_{OH} (mA)	–8	-	-
I_{OL} at V_{OL} (mA)	24	-	-

Note: Per EIA/JESD8-6, "The value of V_{REF} is to be selected by the user to provide optimum noise margin in the use conditions specified by the user."

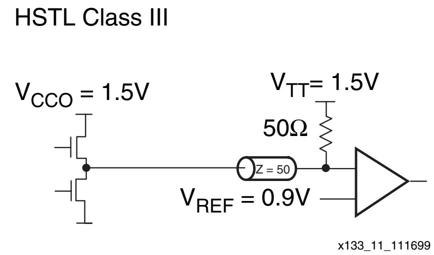

Figure 47: **Terminated HSTL Class III**

A sample circuit illustrating a valid termination technique for HSTL_IV appears in Figure 48.

Table 27: **HSTL Class IV Voltage Specification**

Parameter	Min	Typ	Max
V_{CCO}	1.40	1.50	1.60
V_{REF}	-	0.90	-
V_{TT}	-	V_{CCO}	-
V_{IH}	$V_{REF} + 0.1$	-	-
V_{IL}	-	-	$V_{REF} - 0.1$
V_{OH}	$V_{CCO} - 0.4$	-	-
V_{OL}	-	-	0.4
I_{OH} at V_{OH} (mA)	–8	-	-
I_{OL} at V_{OL} (mA)	48	-	-

Note: Per EIA/JESD8-6, "The value of V_{REF} is to be selected by the user to provide optimum noise margin in the use conditions specified by the user.

Virtex-E Pin-to-Pin Input Parameter Guidelines

All devices are 100% functionally tested. Listed below are representative values for typical pin locations and normal clock loading. Values are expressed in nanoseconds unless otherwise noted

Global Clock Set-Up and Hold for LVTTL Standard, *with* DLL

Description(1)	Symbol	Device	Speed Grade(2, 3)				Units
			Min	-8	-7	-6	
Input Setup and Hold Time Relative to Global Clock Input Signal for LVTTL Standard. For data input with different standards, adjust the setup time delay by the values shown in **IOB Input Switching Characteristics Standard Adjustments**, page 8.							
No Delay	T_{PSDLL}/T_{PHDLL}	XCV50E	1.5 / –0.4	1.5 / –0.4	1.6 / –0.4	1.7 / –0.4	ns
Global Clock and IFF, with DLL		XCV100E	1.5 / –0.4	1.5 / –0.4	1.6 / –0.4	1.7 / –0.4	ns
		XCV200E	1.5 / –0.4	1.5 / –0.4	1.6 / –0.4	1.7 / –0.4	ns
		XCV300E	1.5 / –0.4	1.5 / –0.4	1.6 / –0.4	1.7 / –0.4	ns
		XCV400E	1.5 / –0.4	1.5 / –0.4	1.6 / –0.4	1.7 / –0.4	ns
		XCV600E	1.5 / –0.4	1.5 / –0.4	1.6 / –0.4	1.7 / –0.4	ns
		XCV1000E	1.5 / –0.4	1.5 / –0.4	1.6 / –0.4	1.7 / –0.4	ns
		XCV1600E	1.5 / –0.4	1.5 / –0.4	1.6 / –0.4	1.7 / –0.4	ns
		XCV2000E	1.5 / –0.4	1.5 / –0.4	1.6 / –0.4	1.7 / –0.4	ns
		XCV2600E	1.5 / –0.4	1.5 / –0.4	1.6 / –0.4	1.7 / –0.4	ns
		XCV3200E	1.5 / –0.4	1.5 / –0.4	1.6 / –0.4	1.7 / –0.4	ns

Notes:
1. IFF = Input Flip-Flop or Latch
2. Setup time is measured relative to the Global Clock input signal with the fastest route and the lightest load. Hold time is measured relative to the Global Clock input signal with the slowest route and heaviest load.
3. DLL output jitter is already included in the timing calculation.

HQ240 High-Heat Quad Flat-Pack Packages

XCV600E and XCV1000E devices in High-heat dissipation Quad Flat-pack packages have footprint compatibility. Pins labeled I0_VREF can be used as either in all parts unless device-dependent as indicated in the footnotes. If the pin is not used as V_{REF}, it can be used as general I/O. Immediately following Table 8, see Table 9 for Differential Pair information.

BG432 Ball Grid Array Packages

XCV300E, XCV400E, and XCV600E devices in BG432 Ball Grid Array packages have footprint compatibility. Pins labeled I0_VREF can be used as either in all parts unless device-dependent as indicated in the footnotes. If the pin is not used as V_{REF}, it can be used as general I/O. Immediately following Table 12, see Table 13 for Differential Pair information.

FG456 Fine-Pitch Ball Grid Array Packages

XCV200E and XCV300E devices in FG456 fine-pitch Ball Grid Array packages have footprint compatibility. Pins labeled I0_VREF can be used as either in both devices provided in this package. If the pin is not used as V_{REF}, it can be used as general I/O. Immediately following Table 18, see Table 19 for Differential Pair information.

FG1156 Differential Pin Pairs

Virtex-E devices have differential pin pairs that can also provide other functions when not used as a differential pair. The AO column in Table 29 indicates which devices in this package can use the pin pair as an asynchronous output. The "Other Functions" column indicates alternative function(s) that are not available when the pair is used as a differential pair or differential clock.

Table 29: **FG1156 Differential Pin Pair Summary: XCV1000E, XCV1600E, XCV2000E, XCV2600E, XCV3200E**
