

Welcome to [E-XFL.COM](#)

Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

Details

Product Status	Obsolete
Number of LABs/CLBs	9600
Number of Logic Elements/Cells	43200
Total RAM Bits	655360
Number of I/O	804
Number of Gates	2541952
Voltage - Supply	1.71V ~ 1.89V
Mounting Type	Surface Mount
Operating Temperature	0°C ~ 85°C (TJ)
Package / Case	1156-BBGA
Supplier Device Package	1156-FBGA (35x35)
Purchase URL	https://www.e-xfl.com/product-detail/xilinx/xcv2000e-8fg1156c

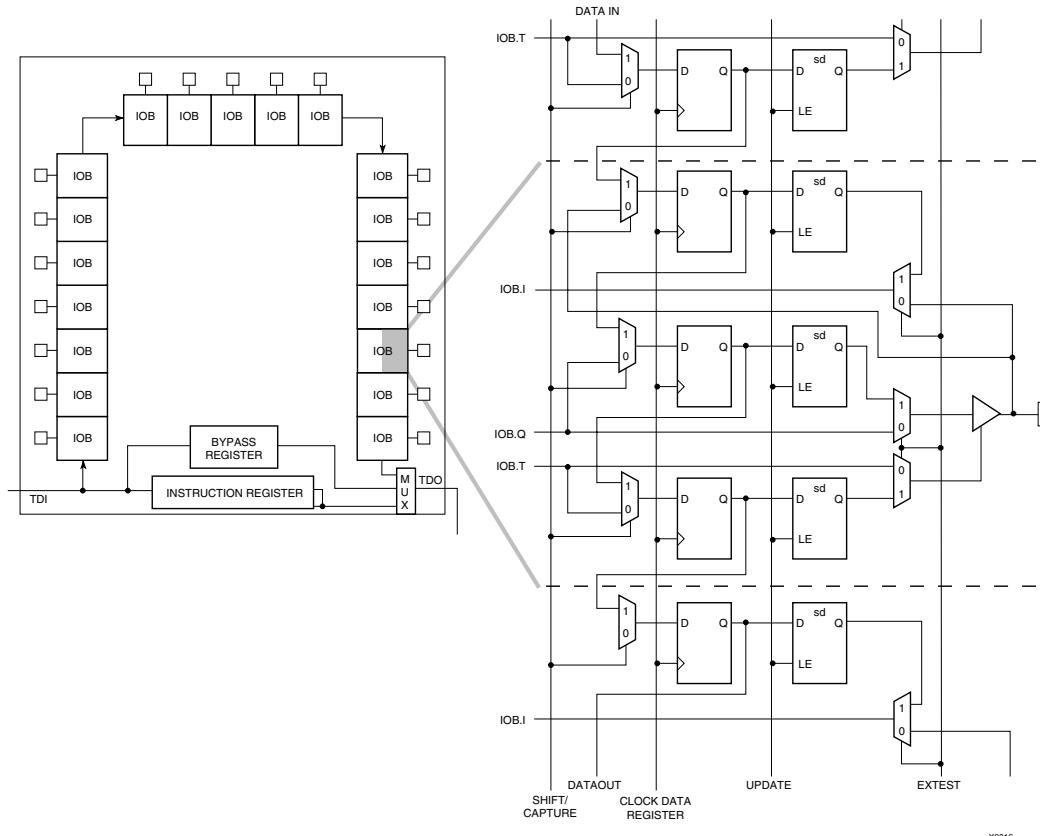

Figure 11: Virtex-E Family Boundary Scan Logic

Instruction Set

The Virtex-E series Boundary Scan instruction set also includes instructions to configure the device and read back configuration data (CFG_IN, CFG_OUT, and JSTART). The complete instruction set is coded as shown in [Table 6](#).

Table 6: Boundary Scan Instructions

Boundary Scan Command	Binary Code(4:0)	Description
EXTEST	00000	Enables Boundary Scan EXTEST operation
SAMPLE/ PRELOAD	00001	Enables Boundary Scan SAMPLE/PRELOAD operation
USER1	00010	Access user-defined register 1
USER2	00011	Access user-defined register 2
CFG_OUT	00100	Access the configuration bus for read operations.

Table 6: Boundary Scan Instructions (Continued)

Boundary Scan Command	Binary Code(4:0)	Description
CFG_IN	00101	Access the configuration bus for write operations.
INTEST	00111	Enables Boundary Scan INTEST operation
USERCODE	01000	Enables shifting out USER code
IDCODE	01001	Enables shifting out of ID Code
HIGHZ	01010	3-states output pins while enabling the Bypass Register
JSTART	01100	Clock the start-up sequence when StartupClk is TCK
BYPASS	11111	Enables BYPASS
RESERVED	All other codes	Xilinx reserved instructions

The voltage reference signal is “banked” within the Virtex-E device on a half-edge basis such that for all packages there are eight independent V_{REF} banks internally. See [Figure 38](#) for a representation of the Virtex-E I/O banks. Within each bank approximately one of every six I/O pins is automatically configured as a V_{REF} input. After placing a differential amplifier input signal within a given V_{REF} bank, the same external source must drive all I/O pins configured as a V_{REF} input.

IBUF placement restrictions require that any differential amplifier input signals within a bank be of the same standard. How to specify a specific location for the IBUF via the LOC property is described below. [Table 19](#) summarizes the Virtex-E input standards compatibility requirements.

An optional delay element is associated with each IBUF. When the IBUF drives a flip-flop within the IOB, the delay element by default activates to ensure a zero hold-time requirement. The NODELAY=TRUE property overrides this default.

When the IBUF does not drive a flip-flop within the IOB, the delay element de-activates by default to provide higher performance. To delay the input signal, activate the delay element with the DELAY=TRUE property.

Table 19: Xilinx Input Standards Compatibility Requirements

Rule 1	Standards with the same input V_{CCO} , output V_{CCO} , and V_{REF} can be placed within the same bank.
--------	--

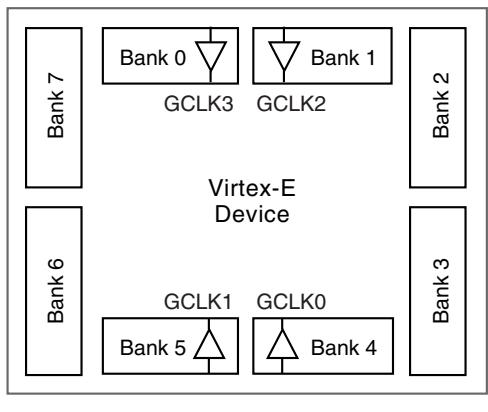

Figure 38: Virtex-E I/O Banks

IBUFG

Signals used as high fanout clock inputs to the Virtex-E device should drive a global clock input buffer (IBUFG) via an external input port in order to take advantage of one of the four dedicated global clock distribution networks. The output of the IBUFG should only drive a CLKDLL,

CLKDLLHF, or BUFG symbol. The generic Virtex-E IBUFG symbol appears in [Figure 39](#).

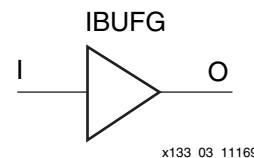

Figure 39: Virtex-E Global Clock Input Buffer (IBUFG) Symbol

The extension to the base name determines which I/O standard is used by the IBUFG. With no extension specified for the generic IBUFG symbol, the assumed standard is LVTTL.

The following list details variations of the IBUFG symbol.

- IBUFG
- IBUFG_LVCMOS2
- IBUFG_PCI33_3
- IBUFG_PCI66_3
- IBUFG_GTL
- IBUFG_GTLP
- IBUFG_HSTL_I
- IBUFG_HSTL_III
- IBUFG_HSTL_IV
- IBUFG_SSTL3_I
- IBUFG_SSTL3_II
- IBUFG_SSTL2_I
- IBUFG_SSTL2_II
- IBUFG_CTT
- IBUFG_AGP
- IBUFG_LVCMOS18
- IBUFG_LVDS
- IBUFG_LVPECL

When the IBUFG symbol supports an I/O standard that requires a differential amplifier input, the IBUFG automatically configures as a differential amplifier input buffer. The low-voltage I/O standards with a differential amplifier input require an external reference voltage input V_{REF} .

The voltage reference signal is “banked” within the Virtex-E device on a half-edge basis such that for all packages there are eight independent V_{REF} banks internally. See [Figure 38](#) for a representation of the Virtex-E I/O banks. Within each bank approximately one of every six I/O pins is automatically configured as a V_{REF} input. After placing a differential amplifier input signal within a given V_{REF} bank, the same external source must drive all I/O pins configured as a V_{REF} input.

IBUFG placement restrictions require any differential amplifier input signals within a bank be of the same standard. The LOC property can specify a location for the IBUFG.

As an added convenience, the BUFGP can be used to instantiate a high fanout clock input. The BUFGP symbol

represents a combination of the LVTTL IBUFG and BUFG symbols, such that the output of the BUFGP can connect directly to the clock pins throughout the design.

Unlike previous architectures, the Virtex-E BUFGP symbol can only be placed in a global clock pad location. The LOC property can specify a location for the BUFGP.

OBUF

An OBUF must drive outputs through an external output port. The generic output buffer (OBUF) symbol appears in [Figure 40](#).

The extension to the base name defines which I/O standard the OBUF uses. With no extension specified for the generic OBUF symbol, the assumed standard is slew rate limited LVTTL with 12 mA drive strength.

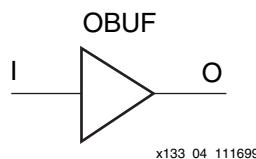

Figure 40: Virtex-E Output Buffer (OBUF) Symbol

The LVTTL OBUF additionally can support one of two slew rate modes to minimize bus transients. By default, the slew rate for each output buffer is reduced to minimize power bus transients when switching non-critical signals.

LVTTL output buffers have selectable drive strengths.

The format for LVTTL OBUF symbol names is as follows:

OBUF_<slew_rate>_<drive_strength>

where <slew_rate> is either F (Fast) or S (Slow), and <drive_strength> is specified in millamps (2, 4, 6, 8, 12, 16, or 24).

The following list details variations of the OBUF symbol.

- OBUF
- OBUF_S_2
- OBUF_S_4
- OBUF_S_6
- OBUF_S_8
- OBUF_S_12
- OBUF_S_16
- OBUF_S_24
- OBUF_F_2
- OBUF_F_4
- OBUF_F_6
- OBUF_F_8
- OBUF_F_12
- OBUF_F_16
- OBUF_F_24
- OBUF_LVCMOS2
- OBUF_PCI33_3

- OBUF_PCI66_3
- OBUF_GTL
- OBUF_GTL_P
- OBUF_HSTL_I
- OBUF_HSTL_III
- OBUF_HSTL_IV
- OBUF_SSTL3_I
- OBUF_SSTL3_II
- OBUF_SSTL2_I
- OBUF_SSTL2_II
- OBUF_CTT
- OBUF_AGP
- OBUF_LVCMOS18
- OBUF_LVDS
- OBUF_LVPECL

The Virtex-E series supports eight banks for the HQ and PQ packages. The CS packages support four V_{CCO} banks.

OBUF placement restrictions require that within a given V_{CCO} bank each OBUF share the same output source drive voltage. Input buffers of any type and output buffers that do not require V_{CCO} can be placed within any V_{CCO} bank. [Table 20](#) summarizes the Virtex-E output compatibility requirements. The LOC property can specify a location for the OBUF.

Table 20: Output Standards Compatibility Requirements

Rule 1	Only outputs with standards that share compatible V_{CCO} can be used within the same bank.
Rule 2	There are no placement restrictions for outputs with standards that do not require a V_{CCO} .
V_{CCO}	Compatible Standards
3.3	LVTTL, SSTL3_I, SSTL3_II, CTT, AGP, GTL, GTL+, PCI33_3, PCI66_3
2.5	SSTL2_I, SSTL2_II, LVCMOS2, GTL, GTL+
1.5	HSTL_I, HSTL_III, HSTL_IV, GTL, GTL+

OBUFT

The generic 3-state output buffer OBUFT (see [Figure 41](#)) typically implements 3-state outputs or bidirectional I/O.

The extension to the base name defines which I/O standard OBUFT uses. With no extension specified for the generic OBUFT symbol, the assumed standard is slew rate limited LVTTL with 12 mA drive strength.

The LVTTL OBUFT additionally can support one of two slew rate modes to minimize bus transients. By default, the slew rate for each output buffer is reduced to minimize power bus transients when switching non-critical signals.

Application Examples

Creating a design with the SelectI/O features requires the instantiation of the desired library symbol within the design code. At the board level, designers need to know the termination techniques required for each I/O standard.

This section describes some common application examples illustrating the termination techniques recommended by each of the standards supported by the SelectI/O features.

Termination Examples

Circuit examples involving typical termination techniques for each of the SelectI/O standards follow. For a full range of accepted values for the DC voltage specifications for each standard, refer to the table associated with each figure.

The resistors used in each termination technique example and the transmission lines depicted represent board level components and are not meant to represent components on the device.

GTL

A sample circuit illustrating a valid termination technique for GTL is shown in Figure 44.

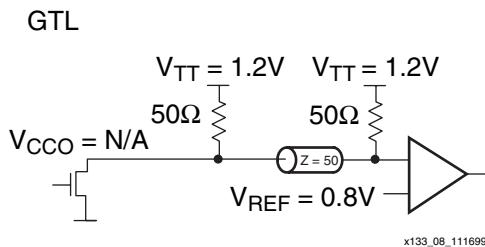

Figure 44: Terminated GTL

Table 23 lists DC voltage specifications.

Table 23: GTL Voltage Specifications

Parameter	Min	Typ	Max
V_{CCO}	-	N/A	-
$V_{REF} = N \times V_{TT}^1$	0.74	0.8	0.86
V_{TT}	1.14	1.2	1.26
$V_{IH} = V_{REF} + 0.05$	0.79	0.85	-
$V_{IL} = V_{REF} - 0.05$	-	0.75	0.81
V_{OH}	-	-	-
V_{OL}	-	0.2	0.4
I_{OH} at V_{OH} (mA)	-	-	-
I_{OL} at V_{OL} (mA) at 0.4V	32	-	-
I_{OL} at V_{OL} (mA) at 0.2V	-	-	40

Notes:

1. N must be greater than or equal to 0.653 and less than or equal to 0.68.

GTL+

A sample circuit illustrating a valid termination technique for GTL+ appears in Figure 45. DC voltage specifications appear in Table 24.

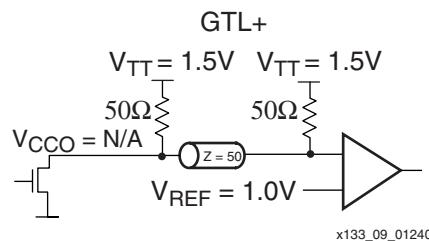

Figure 45: Terminated GTL+

Table 24: GTL+ Voltage Specifications

Parameter	Min	Typ	Max
V_{CCO}	-	-	-
$V_{REF} = N \times V_{TT}^1$	0.88	1.0	1.12
V_{TT}	1.35	1.5	1.65
$V_{IH} = V_{REF} + 0.1$	0.98	1.1	-
$V_{IL} = V_{REF} - 0.1$	-	0.9	1.02
V_{OH}	-	-	-
V_{OL}	0.3	0.45	0.6
I_{OH} at V_{OH} (mA)	-	-	-
I_{OL} at V_{OL} (mA) at 0.6V	36	-	-
I_{OL} at V_{OL} (mA) at 0.3V	-	-	48

Notes:

1. N must be greater than or equal to 0.653 and less than or equal to 0.68.

Input/Output Standard	V _{IL}		V _{IH}		V _{OL}	V _{OH}	I _{OL}	I _{OH}
	V, Min	V, Max	V, Min	V, Max	V, Max	V, Min	mA	mA
CTT	-0.5	V _{REF} - 0.2	V _{REF} + 0.2	3.6	V _{REF} - 0.4	V _{REF} + 0.4	8	-8
AGP	-0.5	V _{REF} - 0.2	V _{REF} + 0.2	3.6	10% V _{CCO}	90% V _{CCO}	Note 2	Note 2

Notes:

1. V_{OL} and V_{OH} for lower drive currents are sample tested.
2. Tested according to the relevant specifications.
3. DC input and output levels for HSTL18 (HSTL I/O standard with V_{CCO} of 1.8 V) are provided in an HSTL white paper on www.xilinx.com.

LVDS DC Specifications

DC Parameter	Symbol	Conditions	Min	Typ	Max	Units
Supply Voltage	V _{CCO}		2.375	2.5	2.625	V
Output High Voltage for Q and \bar{Q}	V _{OH}	R _T = 100 Ω across Q and \bar{Q} signals	1.25	1.425	1.6	V
Output Low Voltage for Q and \bar{Q}	V _{OL}	R _T = 100 Ω across Q and \bar{Q} signals	0.9	1.075	1.25	V
Differential Output Voltage (Q - \bar{Q}), Q = High (\bar{Q} - Q), \bar{Q} = High	V _{ODIFF}	R _T = 100 Ω across Q and \bar{Q} signals	250	350	450	mV
Output Common-Mode Voltage	V _{OCM}	R _T = 100 Ω across Q and \bar{Q} signals	1.125	1.25	1.375	V
Differential Input Voltage (Q - \bar{Q}), Q = High (\bar{Q} - Q), \bar{Q} = High	V _{IDIFF}	Common-mode input voltage = 1.25 V	100	350	NA	mV
Input Common-Mode Voltage	V _{ICM}	Differential input voltage = ±350 mV	0.2	1.25	2.2	V

Note: Refer to the Design Consideration section for termination schematics.

LVPECL DC Specifications

These values are valid at the output of the source termination pack shown under **LVPECL**, with a 100 Ω differential load only. The V_{OH} levels are 200 mV below standard LVPECL levels and are compatible with devices tolerant of lower common-mode ranges. The following table summarizes the DC output specifications of LVPECL.

DC Parameter	Min	Max	Min	Max	Min	Max	Units
V _{CCO}	3.0		3.3		3.6		V
V _{OH}	1.8	2.11	1.92	2.28	2.13	2.41	V
V _{OL}	0.96	1.27	1.06	1.43	1.30	1.57	V
V _{IH}	1.49	2.72	1.49	2.72	1.49	2.72	V
V _{IL}	0.86	2.125	0.86	2.125	0.86	2.125	V
Differential Input Voltage	0.3	-	0.3	-	0.3	-	V

Low Voltage Differential Signals

The Virtex-E family incorporates low-voltage signalling (LVDS and LVPECL). Two pins are utilized for these signals to be connected to a Virtex-E device. These are known as differential pin pairs. Each differential pin pair has a Positive (P) and a Negative (N) pin. These pairs are labeled in the following manner.

IO_L#[P/N]

where

L = LVDS or LVPECL pin
 # = Pin Pair Number
 P = Positive
 N = Negative

I/O pins for differential signals can either be synchronous or asynchronous, input or output. The pin pairs can be used for synchronous input and output signals as well as asynchronous input signals. However, only some of the low-voltage pairs can be used for asynchronous output signals.

Differential signals require the pins of a pair to switch almost simultaneously. If the signals driving the pins are from IOB flip-flops, they are synchronous. If the signals driving the pins are from internal logic, they are asynchronous. **Table 2** defines the names and function of the different types of low-voltage pin pairs in the Virtex-E family.

Table 2: LVDS Pin Pairs

Pin Name	Description
IO_L#[P/N]	Represents a general IO or a synchronous input/output differential signal. When used as a differential signal, N means Negative I/O and P means Positive I/O. Example: IO_L22N
IO_L#[P/N]_Y	Represents a general IO or a synchronous input/output differential signal, or a part-dependent asynchronous output differential signal. Example: IO_L22N_Y
IO_L#[P/N]_YY	Represents a general IO or a synchronous input/output differential signal, or an asynchronous output differential signal. Example: O_L22N_YY
IO_LVDS_DLL_L#[P/N]	Represents a general IO or a synchronous input/output differential signal, a differential clock input signal, or a DLL input. When used as a differential clock input, this pin is paired with the adjacent GCK pin. The GCK pin is always the positive input in the differential clock input configuration. Example: IO_LVDS_DLL_L16N

Virtex-E Package Pinouts

The Virtex-E family of FPGAs is available in 12 popular packages, including chip-scale, plastic and high heat-dissipation quad flat packs, and ball grid and fine-pitch ball grid arrays. Family members have footprint compatibility across devices provided in the same package. The pinout tables in

this section indicate function, pin, and bank information for each package/device combination. Following each pinout table is an additional table summarizing information specific to differential pin pairs for all devices provided in that package.

BG352 Differential Pin Pairs

Virtex-E devices have differential pin pairs that can also provide other functions when not used as a differential pair. A check (✓) in the AO column indicates that the pin pair can be used as an asynchronous output for all devices provided in this package. Pairs with a note number in the AO column are device dependent. They can have asynchronous outputs if the pin pair are in the same CLB row and column in the device. Numbers in this column refer to footnotes that indicate which devices have pin pairs than can be asynchronous outputs. The Other Functions column indicates alternative function(s) not available when the pair is used as a differential pair or differential clock.

FG456 Fine-Pitch Ball Grid Array Packages

XCV200E and XCV300E devices in FG456 fine-pitch Ball Grid Array packages have footprint compatibility. Pins labeled IO_VREF can be used as either in both devices provided in this package. If the pin is not used as V_{REF} , it can be used as general I/O. Immediately following Table 18, see Table 19 for Differential Pair information.

FG1156 Fine-Pitch Ball Grid Array Package

XCV1000E, XCV1600E, XCV2000E, XCV2600E, and XCV3200E devices in the FG1156 fine-pitch Ball Grid Array package have footprint compatibility. Pins labeled IO_VREF can be used as either V_{REF} or general I/O, unless indicated in the footnotes. If the pin is not used as V_{REF} it can be used as general I/O. Immediately following [Table 28](#), see [Table 29](#) for Differential Pair information.

Date	Version	Revision
4/2/01	2.0	<ul style="list-style-type: none"> Updated numerous values in Virtex-E Switching Characteristics tables. Changed pinout table footnotes from "V_{REF} option only" to "V_{REF} or I/O option only" to improve clarity. Converted file to modularized format. See the Virtex-E Data Sheet section.
7/26/01	2.1	<ul style="list-style-type: none"> Changed pinout table footnotes from "V_{REF} or I/O option only" to "V_{REF} or I/O option only; otherwise I/O only" to improve clarity. Changed designation for pin pair 300 in Table 29 from AO to footnote 9.
10/25/01	2.2	<ul style="list-style-type: none"> Changed Table 29 to clarify which devices in the FG1156 package can use each pin pair as an asynchronous output. Updated references to the XCV3200E device in the FG1156 package.
11/15/01	2.3	<ul style="list-style-type: none"> Fixed cosmetic error.
07/17/02	2.4	<ul style="list-style-type: none"> Added "VREF" to the description for pin B15 in Table 12. Changed designation for pin pair 129 in Table 15 from AO to "AO in the XCV1000E, 1600E, 2000E". Data sheet designation upgraded from Preliminary to Production.
03/14/03	2.5	<ul style="list-style-type: none"> Removed the Virtex-E XCV300E section under Pinout Differences Between Virtex and Virtex-E Families (and revised Table 1), since these differences do not exist.

Virtex-E Data Sheet

The Virtex-E Data Sheet contains the following modules:

- DS022-1, Virtex-E 1.8V FPGAs:
[Introduction and Ordering Information \(Module 1\)](#)
- DS022-2, Virtex-E 1.8V FPGAs:
[Functional Description \(Module 2\)](#)
- DS022-3, Virtex-E 1.8V FPGAs:
[DC and Switching Characteristics \(Module 3\)](#)
- DS022-4, Virtex-E 1.8V FPGAs:
[Pinout Tables \(Module 4\)](#)
