

Welcome to [E-XFL.COM](#)

Understanding Embedded - FPGAs (Field Programmable Gate Array)

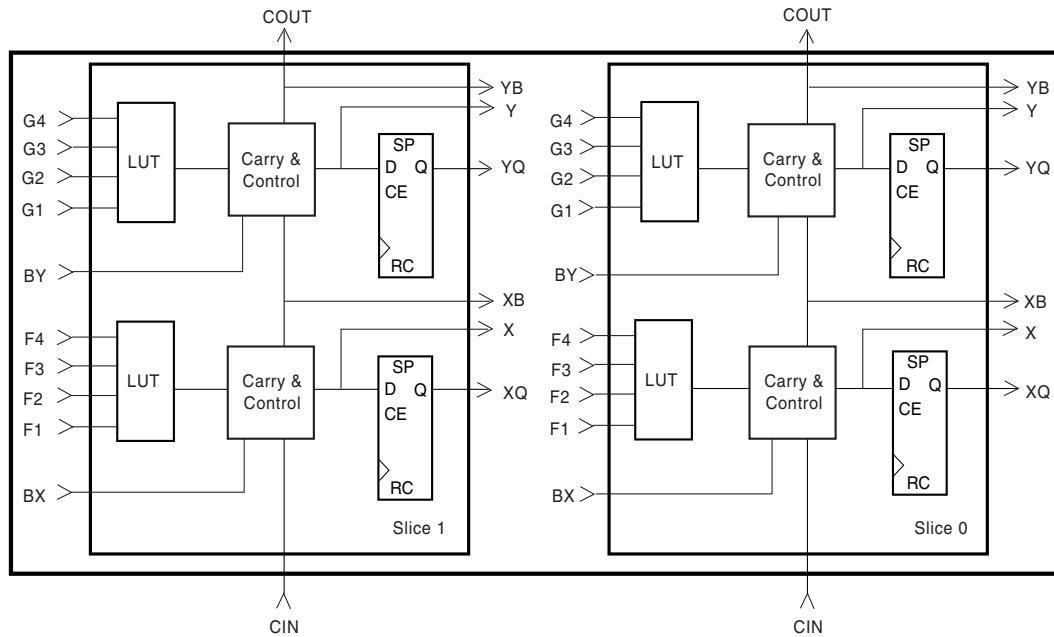

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

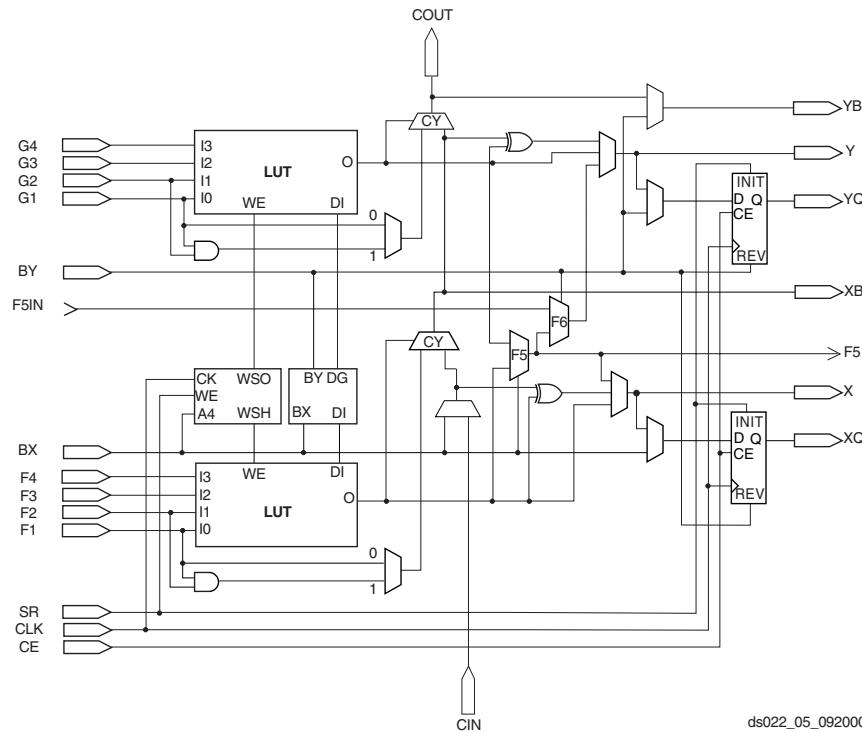

Details

Product Status	Obsolete
Number of LABs/CLBs	1176
Number of Logic Elements/Cells	5292
Total RAM Bits	114688
Number of I/O	176
Number of Gates	306393
Voltage - Supply	1.71V ~ 1.89V
Mounting Type	Surface Mount
Operating Temperature	-40°C ~ 100°C (TJ)
Package / Case	256-BGA
Supplier Device Package	256-FBGA (17x17)
Purchase URL	https://www.e-xfl.com/product-detail/xilinx/xcv200e-6fg256i

Figure 5: Detailed View of Virtex-E Slice

Storage Elements

The storage elements in the Virtex-E slice can be configured either as edge-triggered D-type flip-flops or as level-sensitive latches. The D inputs can be driven either by

the function generators within the slice or directly from slice inputs, bypassing the function generators.

In addition to Clock and Clock Enable signals, each Slice has synchronous set and reset signals (SR and BY). SR

For in-circuit debugging, an optional download and read-back cable is available. This cable connects the FPGA in the target system to a PC or workstation. After downloading the design into the FPGA, the designer can single-step the

logic, readback the contents of the flip-flops, and so observe the internal logic state. Simple modifications can be downloaded into the system in a matter of minutes.

Configuration

Virtex-E devices are configured by loading configuration data into the internal configuration memory. Note that attempting to load an incorrect bitstream causes configuration to fail and can damage the device.

Some of the pins used for configuration are dedicated pins, while others can be re-used as general purpose inputs and outputs once configuration is complete.

The following are dedicated pins:

- Mode pins (M2, M1, M0)
- Configuration clock pin (CCLK)
- PROGRAM pin
- DONE pin
- Boundary Scan pins (TDI, TDO, TMS, TCK)

Depending on the configuration mode chosen, CCLK can be an output generated by the FPGA, or can be generated externally and provided to the FPGA as an input. The PROGRAM pin must be pulled High prior to reconfiguration.

Note that some configuration pins can act as outputs. For correct operation, these pins require a V_{CCO} of 3.3 V or 2.5 V. At 3.3 V the pins operate as LVTTL, and at 2.5 V they

operate as LVCMS. All affected pins fall in banks 2 or 3. The configuration pins needed for SelectMap (CS, Write) are located in bank 1.

Configuration Modes

Virtex-E supports the following four configuration modes.

- Slave-serial mode
- Master-serial mode
- SelectMAP mode
- Boundary Scan mode (JTAG)

The Configuration mode pins (M2, M1, M0) select among these configuration modes with the option in each case of having the IOB pins either pulled up or left floating prior to configuration. The selection codes are listed in [Table 8](#).

Configuration through the Boundary Scan port is always available, independent of the mode selection. Selecting the Boundary Scan mode simply turns off the other modes. The three mode pins have internal pull-up resistors, and default to a logic High if left unconnected. However, it is recommended to drive the configuration mode pins externally.

Table 8: Configuration Codes

Configuration Mode	M2 ⁽¹⁾	M1	M0	CCLK Direction	Data Width	Serial D _{out}	Configuration Pull-ups ⁽¹⁾
Master-serial mode	0	0	0	Out	1	Yes	No
Boundary Scan mode	1	0	1	N/A	1	No	No
SelectMAP mode	1	1	0	In	8	No	No
Slave-serial mode	1	1	1	In	1	Yes	No
Master-serial mode	1	0	0	Out	1	Yes	Yes
Boundary Scan mode	0	0	1	N/A	1	No	Yes
SelectMAP mode	0	1	0	In	8	No	Yes
Slave-serial mode	0	1	1	In	1	Yes	Yes

Notes:

1. M2 is sampled continuously from power up until the end of the configuration. Toggling M2 while INIT is being held externally Low can cause the configuration pull-up settings to change.

indicating that the block SelectRAM+ memory is now disabled. The DO bus retains the last value.

Dual Port Timing

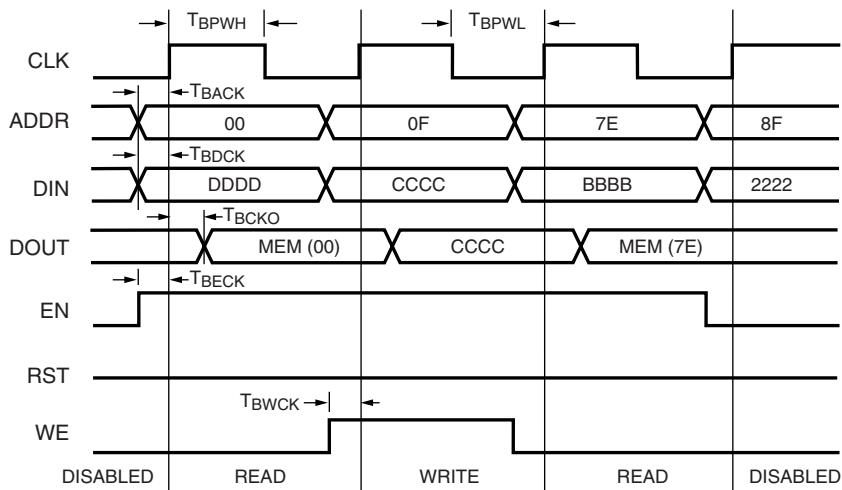

Figure 34 shows a timing diagram for a true dual-port read/write block SelectRAM+ memory. The clock on port A has a longer period than the clock on Port B. The timing parameter T_{BCCS} , (clock-to-clock set-up) is shown on this diagram. The parameter, T_{BCCS} is violated once in the diagram. All other timing parameters are identical to the single port version shown in **Figure 33**.

T_{BCCS} is only of importance when the address of both ports are the same and at least one port is performing a write operation. When the clock-to-clock set-up parameter is violated for a WRITE-WRITE condition, the contents of the memory at that location are invalid. When the clock-to-clock set-up parameter is violated for a WRITE-READ condition,

the contents of the memory are correct, but the read port has invalid data.

At the first rising edge of the CLKA, memory location 0x00 is to be written with the value 0xAAAA and is mirrored on the DOA bus. The last operation of Port B was a read to the same memory location 0x00. The DOB bus of Port B does not change with the new value on Port A, and retains the last read value. A short time later, Port B executes another read to memory location 0x00, and the DOB bus now reflects the new memory value written by Port A.

At the second rising edge of CLKA, memory location 0x7E is written with the value 0x9999 and is mirrored on the DOA bus. Port B then executes a read operation to the same memory location without violating the T_{BCCS} parameter and the DOB reflects the new memory values written by Port A.

ds022_0343_121399

Figure 33: Timing Diagram for Single Port Block SelectRAM+ Memory

LVTTL

LVTTL requires no termination. DC voltage specifications appears in [Table 34](#).

Table 34: LVTTL Voltage Specifications

Parameter	Min	Typ	Max
V_{CCO}	3.0	3.3	3.6
V_{REF}	-	-	-
V_{TT}	-	-	-
V_{IH}	2.0	-	3.6
V_{IL}	-0.5	-	0.8
V_{OH}	2.4	-	-
V_{OL}	-	-	0.4
I_{OH} at V_{OH} (mA)	-24	-	-
I_{OL} at V_{OL} (mA)	24	-	-

Notes:

1. Note: V_{OL} and V_{OH} for lower drive currents sample tested.

LVCMOS2

LVCMOS2 requires no termination. DC voltage specifications appear in [Table 35](#).

Table 35: LVCMOS2 Voltage Specifications

Parameter	Min	Typ	Max
V_{CCO}	2.3	2.5	2.7
V_{REF}	-	-	-
V_{TT}	-	-	-
V_{IH}	1.7	-	3.6
V_{IL}	-0.5	-	0.7
V_{OH}	1.9	-	-
V_{OL}	-	-	0.4
I_{OH} at V_{OH} (mA)	-12	-	-
I_{OL} at V_{OL} (mA)	12	-	-

LVCMOS18

LVCMOS18 does not require termination. [Table 36](#) lists DC voltage specifications.

Table 36: LVCMOS18 Voltage Specifications

Parameter	Min	Typ	Max
V_{CCO}	1.70	1.80	1.90
V_{REF}	-	-	-
V_{TT}	-	-	-
V_{IH}	$0.65 \times V_{CCO}$	-	1.95
V_{IL}	-0.5	-	$0.2 \times V_{CCO}$
V_{OH}	$V_{CCO} - 0.4$	-	-
V_{OL}	-	-	0.4
I_{OH} at V_{OH} (mA)	-8	-	-
I_{OL} at V_{OL} (mA)	8	-	-

AGP-2X

The specification for the AGP-2X standard does not document a recommended termination technique. DC voltage specifications appear in [Table 37](#).

Table 37: AGP-2X Voltage Specifications

Parameter	Min	Typ	Max
V_{CCO}	3.0	3.3	3.6
$V_{REF} = N \times V_{CCO}^{(1)}$	1.17	1.32	1.48
V_{TT}	-	-	-
$V_{IH} = V_{REF} + 0.2$	1.37	1.52	-
$V_{IL} = V_{REF} - 0.2$	-	1.12	1.28
$V_{OH} = 0.9 \times V_{CCO}$	2.7	3.0	-
$V_{OL} = 0.1 \times V_{CCO}$	-	0.33	0.36
I_{OH} at V_{OH} (mA)	Note 2	-	-
I_{OL} at V_{OL} (mA)	Note 2	-	-

Notes:

1. N must be greater than or equal to 0.39 and less than or equal to 0.41.
2. Tested according to the relevant specification.

Table 42: Input Library Macros

Name	Inputs	Outputs

IBUFDS_LDPE_LVDS	I, IB, GE, G, PRE	Q

Creating LVDS Output Buffers

LVDS output buffers can be placed in a wide number of IOB locations. The exact locations are dependent on the package used. The Virtex-E package information lists the possible locations as IO_L#P for the P-side and IO_L#N for the N-side, where # is the pair number.

HDL Instantiation

Both output buffers are required to be instantiated in the design and placed on the correct IO_L#P and IO_L#N locations. The IOB must have the same net source the following pins, clock (C), set/reset (SR), output (O), output clock enable (OCE). In addition, the output (O) pins must be inverted with respect to each other, and if output registers are used, the INIT states must be opposite values (one HIGH and one LOW). Failure to follow these rules leads to DRC errors in software.

VHDL Instantiation

```

data0_p : OBUF_LVDS port map
(I=>data_int(0), O=>data_p(0));

data0_inv: INV      port map
(I=>data_int(0), O=>data_n_int(0));

data0_n : OBUF_LVDS port map
(I=>data_n_int(0), O=>data_n(0));

```

Verilog Instantiation

```

OBUF_LVDS data0_p (.I(data_int[0]),
.O(data_p[0]));

INV      data0_inv (.I(data_int[0],
.O(data_n_int[0]));

OBUF_LVDS data0_n (.I(data_n_int[0]),
.O(data_n[0]));

```

Location Constraints

All LVDS buffers must be explicitly placed on a device. For the output buffers this can be done with the following constraint in the .ucf or .ncf file.

```

NET data_p<0> LOC = D28; # IO_L0P
NET data_n<0> LOC = B29; # IO_L0N

```

Synchronous vs. Asynchronous Outputs

If the outputs are synchronous (registered in the IOB) then any IO_L#PIN pair can be used. If the outputs are asynchronous (no output register), then they must use one of the pairs that are part of the same IOB group at the end of a ROW or COLUMN in the device.

The LVDS pairs that can be used as asynchronous outputs are listed in the Virtex-E pinout tables. Some pairs are marked as asynchronous-capable for all devices in that package, and others are marked as available only for that device in the package. If the device size might change at some point in the product lifetime, then only the common pairs for all packages should be used.

Adding an Output Register

All LVDS buffers can have an output register in the IOB. The output registers must be in both the P-side and N-side IOBs. All the normal IOB register options are available (FD, FDE, FDC, FDCE, FDP, FDPE, FDR, FDRE, FDS, FDSE, LD, LDE, LDC, LDCE, LDP, LDPE). The register elements can be inferred or explicitly instantiated in the HDL code.

Special care must be taken to insure that the D pins of the registers are inverted and that the INIT states of the registers are opposite. The clock pin (C), clock enable (CE) and set/reset (CLR/PRE or S/R) pins must connect to the same source. Failure to do this leads to a DRC error in the software.

The register elements can be packed in the IOB using the IOB property to TRUE on the register or by using the “map -pr [ilob]” where “i” is inputs only, “o” is outputs only and “b” is both inputs and outputs.

To improve design coding times VHDL and Verilog synthesis macro libraries have been developed to explicitly create these structures. The output library macros are listed in [Table 43](#). The O and OB inputs to the macros are the external net connections.

FG680 Differential Pin Pairs

Virtex-E devices have differential pin pairs that can also provide other functions when not used as a differential pair. A √ in the AO column indicates that the pin pair can be used as an asynchronous output for all devices provided in this package. Pairs with a note number in the AO column are device dependent. They can have asynchronous outputs if the pin pair are in the same CLB row and column in the device. Numbers in this column refer to footnotes that indicate which devices have pin pairs than can be asynchronous outputs. The Other Functions column indicates alternative function(s) not available when the pair is used as a differential pair or differential clock.

Date	Version	Revision
4/2/01	2.0	<ul style="list-style-type: none"> Updated numerous values in Virtex-E Switching Characteristics tables. Changed pinout table footnotes from "V_{REF} option only" to "V_{REF} or I/O option only" to improve clarity. Converted file to modularized format. See the Virtex-E Data Sheet section.
7/26/01	2.1	<ul style="list-style-type: none"> Changed pinout table footnotes from "V_{REF} or I/O option only" to "V_{REF} or I/O option only; otherwise I/O only" to improve clarity. Changed designation for pin pair 300 in Table 29 from AO to footnote 9.
10/25/01	2.2	<ul style="list-style-type: none"> Changed Table 29 to clarify which devices in the FG1156 package can use each pin pair as an asynchronous output. Updated references to the XCV3200E device in the FG1156 package.
11/15/01	2.3	<ul style="list-style-type: none"> Fixed cosmetic error.
07/17/02	2.4	<ul style="list-style-type: none"> Added "VREF" to the description for pin B15 in Table 12. Changed designation for pin pair 129 in Table 15 from AO to "AO in the XCV1000E, 1600E, 2000E". Data sheet designation upgraded from Preliminary to Production.
03/14/03	2.5	<ul style="list-style-type: none"> Removed the Virtex-E XCV300E section under Pinout Differences Between Virtex and Virtex-E Families (and revised Table 1), since these differences do not exist.

Virtex-E Data Sheet

The Virtex-E Data Sheet contains the following modules:

- DS022-1, Virtex-E 1.8V FPGAs:
[Introduction and Ordering Information \(Module 1\)](#)
- DS022-2, Virtex-E 1.8V FPGAs:
[Functional Description \(Module 2\)](#)
- DS022-3, Virtex-E 1.8V FPGAs:
[DC and Switching Characteristics \(Module 3\)](#)
- DS022-4, Virtex-E 1.8V FPGAs:
[Pinout Tables \(Module 4\)](#)
