

Welcome to [E-XFL.COM](#)

### **Understanding Embedded - FPGAs (Field Programmable Gate Array)**

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

### **Applications of Embedded - FPGAs**

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

#### **Details**

Product Status	Obsolete
Number of LABs/CLBs	1176
Number of Logic Elements/Cells	5292
Total RAM Bits	114688
Number of I/O	260
Number of Gates	306393
Voltage - Supply	1.71V ~ 1.89V
Mounting Type	Surface Mount
Operating Temperature	0°C ~ 85°C (TJ)
Package / Case	352-LBGA Exposed Pad, Metal
Supplier Device Package	352-MBGA (35x35)
Purchase URL	<a href="https://www.e-xfl.com/product-detail/xilinx/xcv200e-8bg352c">https://www.e-xfl.com/product-detail/xilinx/xcv200e-8bg352c</a>

## Development System

Virtex-E FPGAs are supported by the Xilinx Foundation and Alliance Series CAE tools. The basic methodology for Virtex-E design consists of three interrelated steps: design entry, implementation, and verification. Industry-standard tools are used for design entry and simulation (for example, Synopsys FPGA Express), while Xilinx provides proprietary architecture-specific tools for implementation.

The Xilinx development system is integrated under the Xilinx Design Manager (XDM™) software, providing designers with a common user interface regardless of their choice of entry and verification tools. The XDM software simplifies the selection of implementation options with pull-down menus and on-line help.

Application programs ranging from schematic capture to Placement and Routing (PAR) can be accessed through the XDM software. The program command sequence is generated prior to execution, and stored for documentation.

Several advanced software features facilitate Virtex-E design. RPMs, for example, are schematic-based macros with relative location constraints to guide their placement. They help ensure optimal implementation of common functions.

For HDL design entry, the Xilinx FPGA Foundation development system provides interfaces to the following synthesis design environments.

- Synopsys (FPGA Compiler, FPGA Express)
- Exemplar (Spectrum)
- Synplicity (Synplify)

For schematic design entry, the Xilinx FPGA Foundation and Alliance development system provides interfaces to the following schematic-capture design environments.

- Mentor Graphics V8 (Design Architect, QuickSim II)
- Viewlogic Systems (Viewdraw)

Third-party vendors support many other environments.

A standard interface-file specification, Electronic Design Interchange Format (EDIF), simplifies file transfers into and out of the development system.

Virtex-E FPGAs are supported by a unified library of standard functions. This library contains over 400 primitives and macros, ranging from 2-input AND gates to 16-bit accumulators, and includes arithmetic functions, comparators, counters, data registers, decoders, encoders, I/O functions, latches, Boolean functions, multiplexers, shift registers, and barrel shifters.

The “soft macro” portion of the library contains detailed descriptions of common logic functions, but does not contain any partitioning or placement information. The performance of these macros depends, therefore, on the partitioning and placement obtained during implementation.

RPMs, on the other hand, do contain predetermined partitioning and placement information that permits optimal

implementation of these functions. Users can create their own library of soft macros or RPMs based on the macros and primitives in the standard library.

The design environment supports hierarchical design entry, with high-level schematics that comprise major functional blocks, while lower-level schematics define the logic in these blocks. These hierarchical design elements are automatically combined by the implementation tools. Different design entry tools can be combined within a hierarchical design, thus allowing the most convenient entry method to be used for each portion of the design.

## Design Implementation

The place-and-route tools (PAR) automatically provide the implementation flow described in this section. The partitioner takes the EDIF net list for the design and maps the logic into the architectural resources of the FPGA (CLBs and IOBs, for example). The placer then determines the best locations for these blocks based on their interconnections and the desired performance. Finally, the router interconnects the blocks.

The PAR algorithms support fully automatic implementation of most designs. For demanding applications, however, the user can exercise various degrees of control over the process. User partitioning, placement, and routing information is optionally specified during the design-entry process. The implementation of highly structured designs can benefit greatly from basic floor planning.

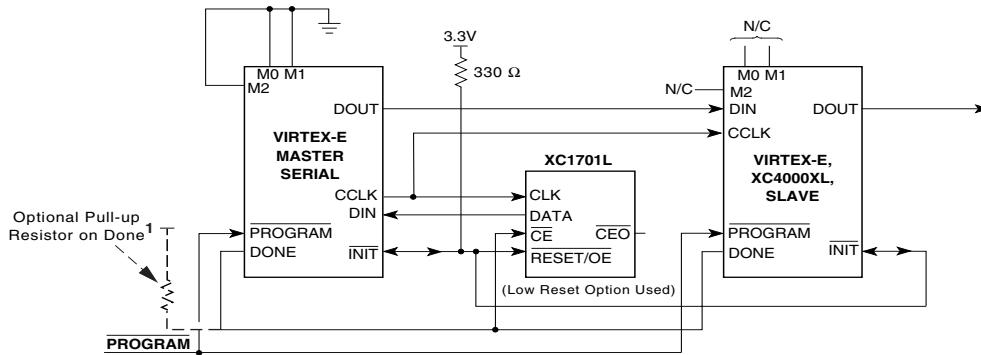

The implementation software incorporates Timing Wizard® timing-driven placement and routing. Designers specify timing requirements along entire paths during design entry. The timing path analysis routines in PAR then recognize these user-specified requirements and accommodate them.

Timing requirements are entered on a schematic in a form directly relating to the system requirements, such as the targeted clock frequency, or the maximum allowable delay between two registers. In this way, the overall performance of the system along entire signal paths is automatically tailored to user-generated specifications. Specific timing information for individual nets is unnecessary.

## Design Verification

In addition to conventional software simulation, FPGA users can use in-circuit debugging techniques. Because Xilinx devices are infinitely reprogrammable, designs can be verified in real time without the need for extensive sets of software simulation vectors.

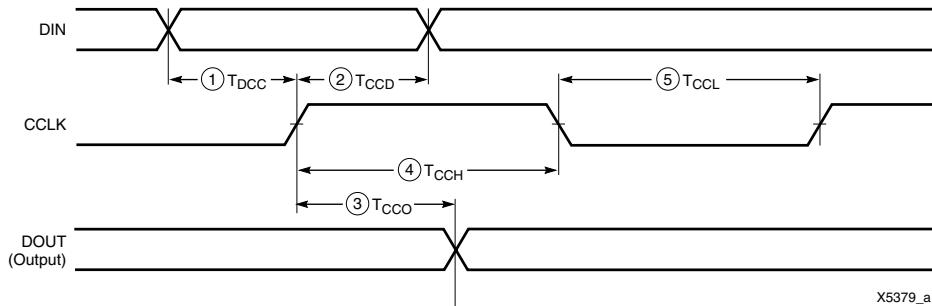

The development system supports both software simulation and in-circuit debugging techniques. For simulation, the system extracts the post-layout timing information from the design database, and back-annotates this information into the net list for use by the simulator. Alternatively, the user can verify timing-critical portions of the design using the TRCE® static timing analyzer.

**Note 1:** If none of the Virtex FPGAs have been selected to drive DONE, an external pull-up resistor of  $330\ \Omega$  should be added to the common DONE line. (For Spartan-XL devices, add a  $4.7K\ \Omega$  pull-up resistor.) This pull-up is not needed if the DriveDONE attribute is set. If used, DriveDONE should be selected only for the last device in the configuration chain.

XCVE\_ds\_013\_050103

**Figure 13: Master/Slave Serial Mode Circuit Diagram**

**Figure 14: Slave-Serial Mode Programming Switching Characteristics**

### Master-Serial Mode

In master-serial mode, the CCLK output of the FPGA drives a Xilinx Serial PROM that feeds bit-serial data to the DIN input. The FPGA accepts this data on each rising CCLK edge. After the FPGA has been loaded, the data for the next device in a daisy-chain is presented on the DOUT pin after the rising CCLK edge. The maximum capacity for a single LOUT/DOUT write is  $2^{20}-1$  (1,048,575) 32-bit words, or 33,554,4000 bits.

The interface is identical to slave-serial except that an internal oscillator is used to generate the configuration clock (CCLK). A wide range of frequencies can be selected for CCLK, which always starts at a slow default frequency. Configuration bits then switch CCLK to a higher frequency for the remainder of the configuration. Switching to a lower frequency is prohibited.

The CCLK frequency is set using the ConfigRate option in the bitstream generation software. The maximum CCLK fre-

quency that can be selected is 60 MHz. When selecting a CCLK frequency, ensure that the serial PROM and any daisy-chained FPGAs are fast enough to support the clock rate.

On power-up, the CCLK frequency is approximately 2.5 MHz. This frequency is used until the ConfigRate bits have been loaded when the frequency changes to the selected ConfigRate. Unless a different frequency is specified in the design, the default ConfigRate is 4 MHz.

In a full master/slave system (Figure 13), the left-most device operates in master-serial mode. The remaining devices operate in slave-serial mode. The SPROM RESET pin is driven by INIT, and the CE input is driven by DONE. There is the potential for contention on the DONE pin, depending on the start-up sequence options chosen.

The sequence of operations necessary to configure a Virtex-E FPGA serially appears in Figure 15.

## Useful Application Examples

The Virtex-E DLL can be used in a variety of creative and useful applications. The following examples show some of the more common applications. The Verilog and VHDL example files are available at:

[ftp://ftp.xilinx.com/pub/applications/xapp/xapp132.zip](http://ftp.xilinx.com/pub/applications/xapp/xapp132.zip)

### Standard Usage

The circuit shown in [Figure 27](#) resembles the BUFGDLL macro implemented to provide access to the RST and LOCKED pins of the CLKDLL.

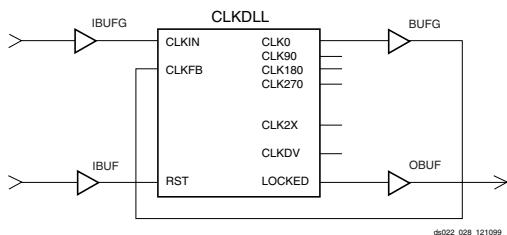

Figure 27: Standard DLL Implementation

### Board Level Deskew of Multiple Non-Virtex-E Devices

The circuit shown in [Figure 28](#) can be used to deskew a system clock between a Virtex-E chip and other non-Virtex-E chips on the same board. This application is commonly used when the Virtex-E device is used in conjunction with other standard products such as SRAM or DRAM devices. While designing the board level route, ensure that the return net delay to the source equals the delay to the other chips involved.

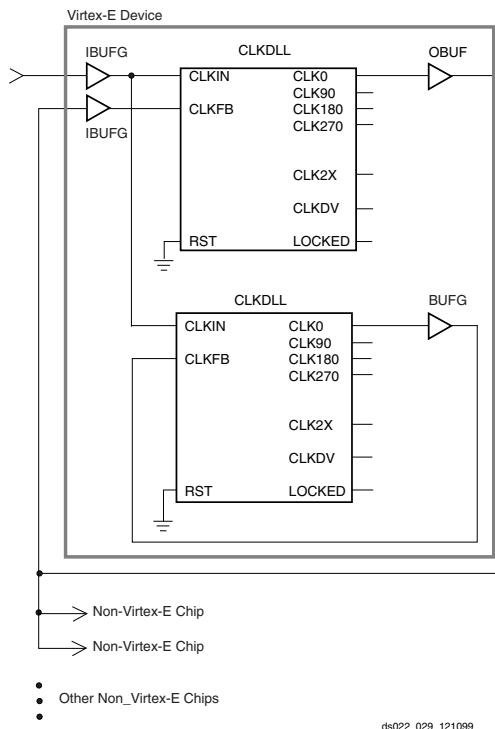

Figure 28: DLL Deskew of Board Level Clock

Board-level deskew is not required for low-fanout clock networks. It is recommended for systems that have fanout limitations on the clock network, or if the clock distribution chip cannot handle the load.

Do not use the DLL output clock signals until after activation of the LOCKED signal. Prior to the activation of the LOCKED signal, the DLL output clocks are not valid and can exhibit glitches, spikes, or other spurious movement.

The `dll_mirror_1` files in the [xapp132.zip](#) file show the VHDL and Verilog implementation of this circuit.

### Deskew of Clock and Its 2x Multiple

The circuit shown in [Figure 29](#) implements a 2x clock multiplier and also uses the CLK0 clock output with a zero ns skew between registers on the same chip. Alternatively, a clock divider circuit can be implemented using similar connections.

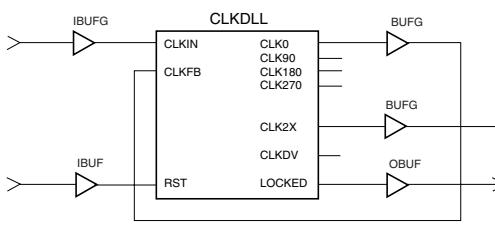

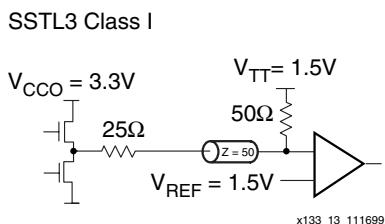

Figure 29: DLL Deskew of Clock and 2x Multiple

## SSTL3\_I

A sample circuit illustrating a valid termination technique for SSTL3\_I appears in [Figure 49](#). DC voltage specifications appear in [Table 28](#).

[Figure 49: Terminated SSTL3 Class I](#)

[Table 28: SSTL3\\_I Voltage Specifications](#)

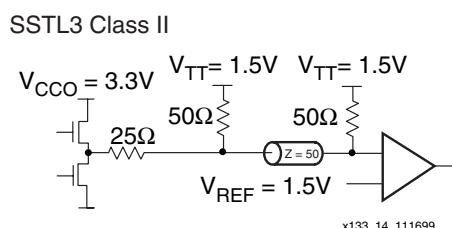

Parameter	Min	Typ	Max
V <sub>CCO</sub>	<b>3.0</b>	<b>3.3</b>	<b>3.6</b>
V <sub>REF</sub> = 0.45 × V <sub>CCO</sub>	1.3	1.5	1.7
V <sub>TT</sub> = V <sub>REF</sub>	1.3	1.5	1.7
V <sub>IH</sub> = V <sub>REF</sub> + 0.2	1.5	1.7	3.9 <sup>(1)</sup>
V <sub>IL</sub> = V <sub>REF</sub> - 0.2	-0.3 <sup>(2)</sup>	1.3	1.5
V <sub>OH</sub> = V <sub>REF</sub> + 0.6	1.9	-	-
V <sub>OL</sub> = V <sub>REF</sub> - 0.6	-	-	1.1
I <sub>OH</sub> at V <sub>OH</sub> (mA)	-8	-	-
I <sub>OL</sub> at V <sub>OL</sub> (mA)	8	-	-

### Notes:

1. V<sub>IH</sub> maximum is V<sub>CCO</sub> + 0.3
2. V<sub>IL</sub> minimum does not conform to the formula

## SSTL3\_II

A sample circuit illustrating a valid termination technique for SSTL3\_II appears in [Figure 50](#). DC voltage specifications appear in [Table 29](#).

[Figure 50: Terminated SSTL3 Class II](#)

[Table 29: SSTL3\\_II Voltage Specifications](#)

Parameter	Min	Typ	Max
V <sub>CCO</sub>	3.0	3.3	3.6
V <sub>REF</sub> = 0.45 × V <sub>CCO</sub>	1.3	1.5	1.7
V <sub>TT</sub> = V <sub>REF</sub>	1.3	1.5	1.7
V <sub>IH</sub> = V <sub>REF</sub> + 0.2	1.5	1.7	3.9 <sup>(1)</sup>
V <sub>IL</sub> = V <sub>REF</sub> - 0.2	-0.3 <sup>(2)</sup>	1.3	1.5
V <sub>OH</sub> = V <sub>REF</sub> + 0.8	2.1	-	-
V <sub>OL</sub> = V <sub>REF</sub> - 0.8	-	-	0.9
I <sub>OH</sub> at V <sub>OH</sub> (mA)	-16	-	-
I <sub>OL</sub> at V <sub>OL</sub> (mA)	16	-	-

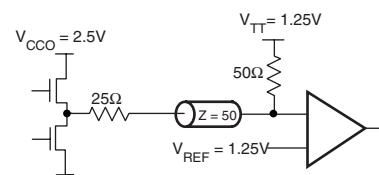

### Notes:

1. V<sub>IH</sub> maximum is V<sub>CCO</sub> + 0.3
2. V<sub>IL</sub> minimum does not conform to the formula

## SSTL2\_I

A sample circuit illustrating a valid termination technique for SSTL2\_I appears in [Figure 51](#). DC voltage specifications appear in [Table 30](#).

### SSTL2 Class I

[Figure 51: Terminated SSTL2 Class I](#)

[Table 30: SSTL2\\_I Voltage Specifications](#)

Parameter	Min	Typ	Max
V <sub>CCO</sub>	2.3	2.5	2.7
V <sub>REF</sub> = 0.5 × V <sub>CCO</sub>	1.15	1.25	1.35
V <sub>TT</sub> = V <sub>REF</sub> + N <sup>(1)</sup>	1.11	1.25	1.39
V <sub>IH</sub> = V <sub>REF</sub> + 0.18	1.33	1.43	3.0 <sup>(2)</sup>
V <sub>IL</sub> = V <sub>REF</sub> - 0.18	-0.3 <sup>(3)</sup>	1.07	1.17
V <sub>OH</sub> = V <sub>REF</sub> + 0.61	1.76	-	-
V <sub>OL</sub> = V <sub>REF</sub> - 0.61	-	-	0.74
I <sub>OH</sub> at V <sub>OH</sub> (mA)	-7.6	-	-
I <sub>OL</sub> at V <sub>OL</sub> (mA)	7.6	-	-

### Notes:

1. N must be greater than or equal to -0.04 and less than or equal to 0.04.
2. V<sub>IH</sub> maximum is V<sub>CCO</sub> + 0.3.
3. V<sub>IL</sub> minimum does not conform to the formula.

Input/Output Standard	V <sub>IL</sub>		V <sub>IH</sub>		V <sub>OL</sub>	V <sub>OH</sub>	I <sub>OL</sub>	I <sub>OH</sub>
	V, Min	V, Max	V, Min	V, Max	V, Max	V, Min	mA	mA
CTT	-0.5	V <sub>REF</sub> - 0.2	V <sub>REF</sub> + 0.2	3.6	V <sub>REF</sub> - 0.4	V <sub>REF</sub> + 0.4	8	-8
AGP	-0.5	V <sub>REF</sub> - 0.2	V <sub>REF</sub> + 0.2	3.6	10% V <sub>CCO</sub>	90% V <sub>CCO</sub>	Note 2	Note 2

**Notes:**

1. V<sub>OL</sub> and V<sub>OH</sub> for lower drive currents are sample tested.
2. Tested according to the relevant specifications.
3. DC input and output levels for HSTL18 (HSTL I/O standard with V<sub>CCO</sub> of 1.8 V) are provided in an HSTL white paper on [www.xilinx.com](http://www.xilinx.com).

**LVDS DC Specifications**

DC Parameter	Symbol	Conditions	Min	Typ	Max	Units
Supply Voltage	V <sub>CCO</sub>		2.375	2.5	2.625	V
Output High Voltage for Q and $\bar{Q}$	V <sub>OH</sub>	R <sub>T</sub> = 100 Ω across Q and $\bar{Q}$ signals	1.25	1.425	1.6	V
Output Low Voltage for Q and $\bar{Q}$	V <sub>OL</sub>	R <sub>T</sub> = 100 Ω across Q and $\bar{Q}$ signals	0.9	1.075	1.25	V
Differential Output Voltage (Q - $\bar{Q}$ ), Q = High ( $\bar{Q}$ - Q), $\bar{Q}$ = High	V <sub>ODIFF</sub>	R <sub>T</sub> = 100 Ω across Q and $\bar{Q}$ signals	250	350	450	mV
Output Common-Mode Voltage	V <sub>OCM</sub>	R <sub>T</sub> = 100 Ω across Q and $\bar{Q}$ signals	1.125	1.25	1.375	V
Differential Input Voltage (Q - $\bar{Q}$ ), Q = High ( $\bar{Q}$ - Q), $\bar{Q}$ = High	V <sub>IDIFF</sub>	Common-mode input voltage = 1.25 V	100	350	NA	mV
Input Common-Mode Voltage	V <sub>ICM</sub>	Differential input voltage = ±350 mV	0.2	1.25	2.2	V

Note: Refer to the Design Consideration section for termination schematics.

**LVPECL DC Specifications**

These values are valid at the output of the source termination pack shown under **LVPECL**, with a 100 Ω differential load only. The V<sub>OH</sub> levels are 200 mV below standard LVPECL levels and are compatible with devices tolerant of lower common-mode ranges. The following table summarizes the DC output specifications of LVPECL.

DC Parameter	Min	Max	Min	Max	Min	Max	Units
V <sub>CCO</sub>	3.0		3.3		3.6		V
V <sub>OH</sub>	1.8	2.11	1.92	2.28	2.13	2.41	V
V <sub>OL</sub>	0.96	1.27	1.06	1.43	1.30	1.57	V
V <sub>IH</sub>	1.49	2.72	1.49	2.72	1.49	2.72	V
V <sub>IL</sub>	0.86	2.125	0.86	2.125	0.86	2.125	V
Differential Input Voltage	0.3	-	0.3	-	0.3	-	V

## CS144 Chip-Scale Package

XCV50E, XCV100E, XCV200E, XCV300E and XCV400E devices in CS144 Chip-scale packages have footprint compatibility. In the CS144 package, bank pairs that share a side are internally interconnected, permitting four choices for  $V_{CCO}$ . See [Table 3](#).

**Table 3: I/O Bank Pairs and Shared V<sub>CCO</sub> Pins**

Paired Banks	Shared V <sub>CCO</sub> Pins
Banks 0 & 1	A2, A13, D7
Banks 2 & 3	B12, G11, M13
Banks 4 & 5	N1, N7, N13
Banks 6 & 7	B2, G2, M2

Pins labeled IO\_VREF can be used as either in all parts unless device-dependent, as indicated in the footnotes. If the pin is not used as  $V_{REF}$  it can be used as general I/O. Immediately following [Table 4](#), see [Table 5](#) is Differential Pair information.

## HQ240 Differential Pin Pairs

Virtex-E devices have differential pin pairs that can also provide other functions when not used as a differential pair. A √ in the AO column indicates that the pin pair can be used as an asynchronous output for all devices provided in this package. Pairs with a note number in the AO column are device dependent. They can have asynchronous outputs if the pin pair are in the same CLB row and column in the device. Numbers in this column refer to footnotes that indicate which devices have pin pairs than can be asynchronous outputs. The Other Functions column indicates alternative function(s) not available when the pair is used as a differential pair or differential clock.

**FG256 Fine-Pitch Ball Grid Array Packages**

XCV50E, XCV100E, XCV200E, and XCV300E devices in FG256 fine-pitch Ball Grid Array packages have footprint compatibility. Pins labeled IO\_VREF can be used as either in all parts unless device-dependent as indicated in the footnotes. If the pin is not used as V<sub>REF</sub>, it can be used as general I/O. Immediately following Table 16, see Table 17 for Differential Pair information.

## FG860 Differential Pin Pairs

Virtex-E devices have differential pin pairs that can also provide other functions when not used as a differential pair. A √ in the AO column indicates that the pin pair can be used as an asynchronous output for all devices provided in this package. Pairs with a note number in the AO column are device dependent. They can have asynchronous outputs if the pin pair are in the same CLB row and column in the device. Numbers in this column refer to footnotes that indicate which devices have pin pairs than can be asynchronous outputs. The Other Functions column indicates alternative function(s) not available when the pair is used as a differential pair or differential clock.
