Welcome to E-XFL.COM

Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

Details	
Product Status	Obsolete
Number of LABs/CLBs	12696
Number of Logic Elements/Cells	57132
Total RAM Bits	753664
Number of I/O	804
Number of Gates	3263755
Voltage - Supply	1.71V ~ 1.89V
Mounting Type	Surface Mount
Operating Temperature	0°C ~ 85°C (TJ)
Package / Case	1156-BBGA
Supplier Device Package	1156-FBGA (35x35)
Purchase URL	https://www.e-xfl.com/product-detail/xilinx/xcv2600e-7fg1156c

resources. The abundance of routing resources permits the Virtex-E family to accommodate even the largest and most complex designs.

Virtex-E FPGAs are SRAM-based, and are customized by loading configuration data into internal memory cells. Configuration data can be read from an external SPROM (master serial mode), or can be written into the FPGA (SelectMAP™, slave serial, and JTAG modes).

The standard Xilinx Foundation Series™ and Alliance Series™ Development systems deliver complete design support for Virtex-E, covering every aspect from behavioral and schematic entry, through simulation, automatic design translation and implementation, to the creation and downloading of a configuration bit stream.

Higher Performance

Virtex-E devices provide better performance than previous generations of FPGAs. Designs can achieve synchronous system clock rates up to 240 MHz including I/O or 622 Mb/s using Source Synchronous data transmission architectures. Virtex-E I/Os comply fully with 3.3 V PCI specifications, and interfaces can be implemented that operate at 33 MHz or 66 MHz.

While performance is design-dependent, many designs operate internally at speeds in excess of 133 MHz and can achieve over 311 MHz. Table 2 shows performance data for representative circuits, using worst-case timing parameters.

Table 2: **Performance for Common Circuit Functions**

Function	Bits	Virtex-E (-7)
Register-to-Register		
Adder	16 64	4.3 ns 6.3 ns
Pipelined Multiplier	8 x 8 16 x 16	4.4 ns 5.1 ns

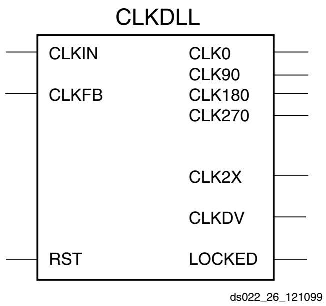

Figure 22: **Standard DLL Symbol CLKDLL**

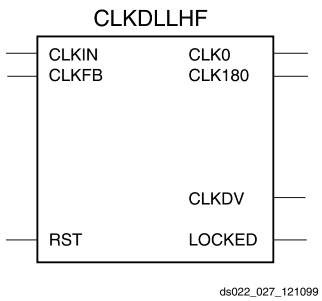

Figure 23: **High Frequency DLL Symbol CLKDLLHF**

BUFGDLL Pin Descriptions

Use the BUFGDLL macro as the simplest way to provide zero propagation delay for a high-fanout on-chip clock from an external input. This macro uses the IBUFG, CLKDLL and BUFG primitives to implement the most basic DLL application as shown in Figure 24.

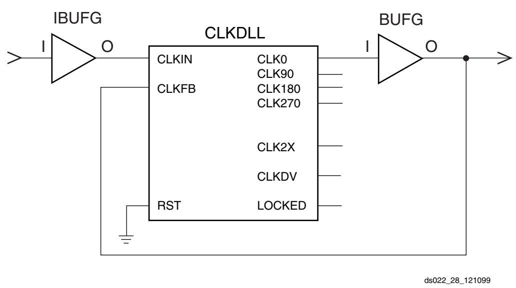

Figure 24: **BUFGDLL Schematic**

This symbol does not provide access to the advanced clock domain controls or to the clock multiplication or clock division features of the DLL. This symbol also does not provide access to the RST, or LOCKED pins of the DLL. For access to these features, a designer must use the library DLL primitives described in the following sections.

Source Clock Input — I

The I pin provides the user source clock, the clock signal on which the DLL operates, to the BUFGDLL. For the BUFGDLL macro the source clock frequency must fall in the low frequency range as specified in the data sheet. The BUFGDLL requires an external signal source clock. Therefore, only an external input port can source the signal that drives the BUFGDLL I pin.

Clock Output — O

The clock output pin O represents a delay-compensated version of the source clock (I) signal. This signal, sourced by a global clock buffer BUFG symbol, takes advantage of the dedicated global clock routing resources of the device.

The output clock has a 50-50 duty cycle unless you deactivate the duty cycle correction property.

CLKDLL Primitive Pin Descriptions

The library CLKDLL primitives provide access to the complete set of DLL features needed when implementing more complex applications with the DLL.

Source Clock Input — CLKIN

The CLKIN pin provides the user source clock (the clock signal on which the DLL operates) to the DLL. The CLKIN frequency must fall in the ranges specified in the data sheet. A global clock buffer (BUFG) driven from another CLKDLL, one of the global clock input buffers (IBUFG), or an IO_LVDS_DLL pin on the same edge of the device (top or bottom) must source this clock signal. There are four IO_LVDS_DLL input pins that can be used as inputs to the DLLs. This makes a total of eight usable input pins for DLLs in the Virtex-E family.

Feedback Clock Input — CLKFB

The DLL requires a reference or feedback signal to provide the delay-compensated output. Connect only the CLK0 or CLK2X DLL outputs to the feedback clock input (CLKFB) pin to provide the necessary feedback to the DLL. The feedback clock input can also be provided through one of the following pins.

IBUFG - Global Clock Input Pad

IO_LVDS_DLL - the pin adjacent to IBUFG

If an IBUFG sources the CLKFB pin, the following special rules apply.

1. An external input port must source the signal that drives the IBUFG I pin.
2. The CLK2X output must feedback to the device if both the CLK0 and CLK2X outputs are driving off chip devices.
3. That signal must directly drive only OBUFs and nothing else.

These rules enable the software determine which DLL clock output sources the CLKFB pin.

Reset Input — RST

When the reset pin RST activates the LOCKED signal deactivates within four source clock cycles. The RST pin, active High, must either connect to a dynamic signal or tied to

Port Signals

Each block SelectRAM+ port operates independently of the others while accessing the same set of 4096 memory cells.

Table 15 describes the depth and width aspect ratios for the block SelectRAM+ memory.

Table 15: **Block SelectRAM+ Port Aspect Ratios**

Width	Depth	ADDR Bus	Data Bus
1	4096	ADDR<11:0>	DATA<0>
2	2048	ADDR<10:0>	DATA<1:0>
4	1024	ADDR<9:0>	DATA<3:0>
8	512	ADDR<8:0>	DATA<7:0>
16	256	ADDR<7:0>	DATA<15:0>

Clock—CLK[A|B]

Each port is fully synchronous with independent clock pins. All port input pins have setup time referenced to the port CLK pin. The data output bus has a clock-to-out time referenced to the CLK pin.

Enable—EN[A|B]

The enable pin affects the read, write and reset functionality of the port. Ports with an inactive enable pin keep the output pins in the previous state and do not write data to the memory cells.

Write Enable—WE[A|B]

Activating the write enable pin allows the port to write to the memory cells. When active, the contents of the data input bus are written to the RAM at the address pointed to by the address bus, and the new data also reflects on the data out bus. When inactive, a read operation occurs and the contents of the memory cells referenced by the address bus reflect on the data out bus.

Reset—RST[A|B]

The reset pin forces the data output bus latches to zero synchronously. This does not affect the memory cells of the RAM and does not disturb a write operation on the other port.

Address Bus—ADDR[A|B]<#:0>

The address bus selects the memory cells for read or write. The width of the port determines the required width of this bus as shown in Table 15.

Data In Bus—DI[A|B]<#:0>

The data in bus provides the new data value to be written into the RAM. This bus and the port have the same width, as shown in Table 15.

Data Output Bus—DO[A|B]<#:0>

The data out bus reflects the contents of the memory cells referenced by the address bus at the last active clock edge. During a write operation, the data out bus reflects the data in bus. The width of this bus equals the width of the port. The allowed widths appear in Table 15.

Inverting Control Pins

The four control pins (CLK, EN, WE and RST) for each port have independent inversion control as a configuration option.

Address Mapping

Each port accesses the same set of 4096 memory cells using an addressing scheme dependent on the width of the port.

The physical RAM location addressed for a particular width are described in the following formula (of interest only when the two ports use different aspect ratios).

$$Start = ((ADDR_{port} + 1) * Width_{port}) - 1$$

$$End = ADDR_{port} * Width_{port}$$

Conflict Resolution

The block SelectRAM+ memory is a true dual-read/write port RAM that allows simultaneous access of the same memory cell from both ports. When one port writes to a given memory cell, the other port must not address that memory cell (for a write or a read) within the clock-to-clock setup window. The following lists specifics of port and memory cell write conflict resolution.

- If both ports write to the same memory cell simultaneously, violating the clock-to-clock setup requirement, consider the data stored as invalid.
- If one port attempts a read of the same memory cell the other simultaneously writes, violating the clock-to-clock setup requirement, the following occurs.
  - The write succeeds
  - The data out on the writing port accurately reflects the data written.
  - The data out on the reading port is invalid.

Conflicts do not cause any physical damage.

Table 16 shows low order address mapping for each port width.

Table 16: **Port Address Mapping**

Port Width	Port Addresses																
1	4095...	15	14	13	12	11	10	09	08	07	06	05	04	03	02	01	00
2	2047...	07		06		05		04		03		02		01		00	
4	1023...	03				02				01				00			
8	511...	01								00							
16	255...	00															

Creating Larger RAM Structures

The block SelectRAM+ columns have specialized routing to allow cascading blocks together with minimal routing delays. This achieves wider or deeper RAM structures with a smaller timing penalty than when using normal routing channels.

Location Constraints

Block SelectRAM+ instances can have LOC properties attached to them to constrain the placement. The block SelectRAM+ placement locations are separate from the CLB location naming convention, allowing the LOC properties to transfer easily from array to array.

The LOC properties use the following form.

LOC = RAMB4_R#C#

RAMB4_R0C0 is the upper left RAMB4 location on the device.

Single Port Timing

Figure 33 shows a timing diagram for a single port of a block SelectRAM+ memory. The block SelectRAM+ AC switching characteristics are specified in the data sheet. The block SelectRAM+ memory is initially disabled.

At the first rising edge of the CLK pin, the ADDR, DI, EN, WE, and RST pins are sampled. The EN pin is High and the WE pin is Low indicating a read operation. The DO bus contains the contents of the memory location, 0x00, as indicated by the ADDR bus.

At the second rising edge of the CLK pin, the ADDR, DI, EN, WR, and RST pins are sampled again. The EN and WE pins are High indicating a write operation. The DO bus mirrors the DI bus. The DI bus is written to the memory location 0x0F.

At the third rising edge of the CLK pin, the ADDR, DI, EN, WR, and RST pins are sampled again. The EN pin is High and the WE pin is Low indicating a read operation. The DO bus contains the contents of the memory location 0x7E as indicated by the ADDR bus.

At the fourth rising edge of the CLK pin, the ADDR, DI, EN, WR, and RST pins are sampled again. The EN pin is Low

SSTL2_II

A sample circuit illustrating a valid termination technique for SSTL2_II appears in Figure 52. DC voltage specifications appear in Table 31.

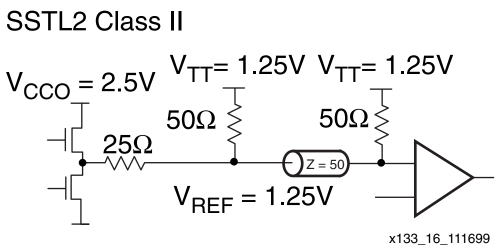

Figure 52: **Terminated SSTL2 Class II**

Table 31: **SSTL2_II Voltage Specifications**

Parameter	Min	Typ	Max
V_{CCO}	2.3	2.5	2.7
$V_{REF} = 0.5 \times V_{CCO}$	1.15	1.25	1.35
$V_{TT} = V_{REF} + N^{(1)}$	1.11	1.25	1.39
$V_{IH} = V_{REF} + 0.18$	1.33	1.43	$3.0^{(2)}$
$V_{IL} = V_{REF} - 0.18$	$-0.3^{(3)}$	1.07	1.17
$V_{OH} = V_{REF} + 0.8$	1.95	-	-
$V_{OL} = V_{REF} - 0.8$	-	-	0.55
I_{OH} at V_{OH} (mA)	–15.2	-	-
I_{OL}at V_{OL} (mA)	15.2	-	-

Notes:
1. N must be greater than or equal to -0.04 and less than or equal to 0.04.
2. V_{IH} maximum is V_{CCO} + 0.3.
3. V_{IL} minimum does not conform to the formula.

CTT

A sample circuit illustrating a valid termination technique for CTT appear in Figure 53. DC voltage specifications appear in Table 32.

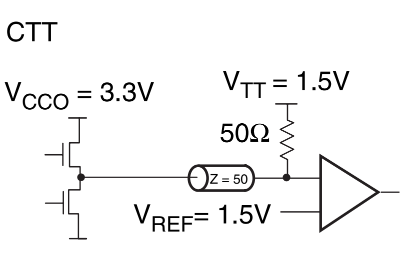

Figure 53: **Terminated CTT**

Table 32: **CTT Voltage Specifications**

Parameter	Min	Typ	Max
V_{CCO}	$2.05^{(1)}$	3.3	3.6
V_{REF}	1.35	1.5	1.65
V_{TT}	1.35	1.5	1.65
$V_{IH} = V_{REF} + 0.2$	1.55	1.7	-
$V_{IL} = V_{REF} - 0.2$	-	1.3	1.45
$V_{OH} = V_{REF} + 0.4$	1.75	1.9	-
$V_{OL} = V_{REF} - 0.4$	-	1.1	1.25
I_{OH} at V_{OH} (mA)	–8	-	-
I_{OL}at V_{OL} (mA)	8	-	-

Notes:
1. Timing delays are calculated based on V_{CCO} min of 3.0V.

PCI33_3 & PCI66_3

PCI33_3 or PCI66_3 require no termination. DC voltage specifications appear in Table 33.

Table 33: **PCI33_3 and PCI66_3 Voltage Specifications**

Parameter	Min	Typ	Max
V_{CCO}	3.0	3.3	3.6
V_{REF}	-	-	-
V_{TT}	-	-	-
$V_{IH} = 0.5 \times V_{CCO}$	1.5	1.65	$V_{CCO} + 0.5$
$V_{IL} = 0.3 \times V_{CCO}$	–0.5	0.99	1.08
$V_{OH} = 0.9 \times V_{CCO}$	2.7	-	-
$V_{OL} = 0.1 \times V_{CCO}$	-	-	0.36
I_{OH} at V_{OH} (mA)	Note 1	-	-
I_{OL}at V_{OL} (mA)	Note 1	-	-

Notes:
1. Tested according to the relevant specification.

IOB Output Switching Characteristics, Figure 1

Output delays terminating at a pad are specified for LVTTL with 12 mA drive and fast slew rate. For other standards, adjust the delays with the values shown in **IOB Output Switching Characteristics Standard Adjustments**, page 10.

Clock CLK						
Minimum Pulse Width, High	T_{CH}	0.56	1.2	1.3	1.4	ns, min
Minimum Pulse Width, Low	T_{CL}	0.56	1.2	1.3	1.4	ns, min
Set/Reset						
Minimum Pulse Width, SR/BY inputs	T_{RPW}	0.94	1.9	2.1	2.4	ns, min
Delay from SR/BY inputs to XQ/YQ outputs (asynchronous)	T_{RQ}	0.39	0.8	0.9	1.0	ns, max
Toggle Frequency (MHz) (for export control)	F_{TOG}	-	416	400	357	MHz

Notes:
1. A Zero “0” Hold Time listing indicates no hold time or a negative hold time. Negative values can not be guaranteed “best-case”, but if a “0” is listed, there is no positive hold time.

Low Voltage Differential Signals

The Virtex-E family incorporates low-voltage signalling (LVDS and LVPECL). Two pins are utilized for these signals to be connected to a Virtex-E device. These are known as differential pin pairs. Each differential pin pair has a Positive (P) and a Negative (N) pin. These pairs are labeled in the following manner.

IO_L#[P/N]

where

L = LVDS or LVPECL pin
# = Pin Pair Number
P = Positive
N = Negative

I/O pins for differential signals can either be synchronous or asynchronous, input or output. The pin pairs can be used for synchronous input and output signals as well as asynchronous input signals. However, only some of the low-voltage pairs can be used for asynchronous output signals.

DIfferential signals require the pins of a pair to switch almost simultaneously. If the signals driving the pins are from IOB flip-flops, they are synchronous. If the signals driving the pins are from internal logic, they are asynchronous. Table 2 defines the names and function of the different types of low-voltage pin pairs in the Virtex-E family.

Table 2: **LVDS Pin Pairs**

Pin Name	Description
IO_L#[P/N] Example: IO_L22N	Represents a general IO or a synchronous input/output differential signal. When used as a differential signal, N means Negative I/O and P means Positive I/O.
IO_L#[P/N]_Y Example: IO_L22N_Y	Represents a general IO or a synchronous input/output differential signal, or a part-dependent asynchronous output differential signal.
IO_L#[P/N]_YY Example: O_L22N_YY	Represents a general IO or a synchronous input/output differential signal, or an asynchronous output differential signal.
IO_LVDS_DLL_L#[P/N] Example: IO_LVDS_DLL_L16N	Represents a general IO or a synchronous input/output differential signal, a differential clock input signal, or a DLL input. When used as a differential clock input, this pin is paired with the adjacent GCK pin. The GCK pin is always the positive input in the differential clock input configuration.

Virtex-E Package Pinouts

The Virtex-E family of FPGAs is available in 12 popular packages, including chip-scale, plastic and high heat-dissipation quad flat packs, and ball grid and fine-pitch ball grid arrays. Family members have footprint compatibility across devices provided in the same package. The pinout tables in this section indicate function, pin, and bank information for each package/device combination. Following each pinout table is an additional table summarizing information specific to differential pin pairs for all devices provided in that package.

Table 12: **BG432 — XCV300E, XCV400E, XCV600E**

BG432 Differential Pin Pairs

Virtex-E devices have differential pin pairs that can also Virtex-E devices have differential pin pairs that can also provide other functions when not used as a differential pair. A √ in the AO column indicates that the pin pair can be used as an asynchronous output for all devices provided in this package. Pairs with a note number in the AO column are device dependent. They can have asynchronous outputs if the pin pair are in the same CLB row and column in the device. Numbers in this column refer to footnotes that indicate which devices have pin pairs than can be asynchronous outputs. The Other Functions column indicates alternative function(s) not available when the pair is used as a differential pair or differential clock.

Date	Version	Revision
4/2/01	2.0	• Updated numerous values in **Virtex-E Switching Characteristics** tables. • Changed pinout table footnotes from "V_{REF} option only" to "V_{REF} or I/O option only" to improve clarity. • Converted file to modularized format. See the **Virtex-E Data Sheet** section.
7/26/01	2.1	• Changed pinout table footnotes from "V_{REF} or I/O option only" to "V_{REF} or I/O option only; otherwise I/O only" to improve clarity. • Changed designation for pin pair 300 in Table 29 from AO to footnote 9.
10/25/01	2.2	• Changed Table 29 to clarify which devices in the FG1156 package can use each pin pair as an asynchronous output. • Updated references to the XCV3200E device in the FG1156 package.
11/15/01	2.3	• Fixed cosmetic error.
07/17/02	2.4	• Added "VREF" to the description for pin B15 in Table 12. • Changed designation for pin pair 129 in Table 15 from AO to "AO in the XCV1000E, 1600E, 2000E". • Data sheet designation upgraded from Preliminary to Production.
03/14/03	2.5	• Removed the Virtex-E XCV300E section under **Pinout Differences Between Virtex and Virtex-E Families** (and revised Table 1), since these differences do not exist.

Virtex-E Data Sheet

The Virtex-E Data Sheet contains the following modules:

- DS022-1, Virtex-E 1.8V FPGAs: **Introduction and Ordering Information (Module 1)**
- DS022-2, Virtex-E 1.8V FPGAs: **Functional Description (Module 2)**
- DS022-3, Virtex-E 1.8V FPGAs: **DC and Switching Characteristics (Module 3)**
- DS022-4, Virtex-E 1.8V FPGAs: **Pinout Tables (Module 4)**
