

Welcome to [E-XFL.COM](https://www.e-xfl.com)

Understanding [Embedded - FPGAs \(Field Programmable Gate Array\)](#)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details

Product Status	Obsolete
Number of LABs/CLBs	2400
Number of Logic Elements/Cells	10800
Total RAM Bits	163840
Number of I/O	316
Number of Gates	569952
Voltage - Supply	1.71V ~ 1.89V
Mounting Type	Surface Mount
Operating Temperature	0°C ~ 85°C (Tj)
Package / Case	432-LBGA Exposed Pad, Metal
Supplier Device Package	432-MBGA (40x40)
Purchase URL	https://www.e-xfl.com/product-detail/xilinx/xcv400e-8bg432c

Table 1: Virtex-E Field-Programmable Gate Array Family Members

Device	System Gates	Logic Gates	CLB Array	Logic Cells	Differential I/O Pairs	User I/O	BlockRAM Bits	Distributed RAM Bits
XCV50E	71,693	20,736	16 x 24	1,728	83	176	65,536	24,576

Virtex-E Compared to Virtex Devices

The Virtex-E family offers up to 43,200 logic cells in devices up to 30% faster than the Virtex family.

I/O performance is increased to 622 Mb/s using Source Synchronous data transmission architectures and synchronous system performance up to 240 MHz using single-ended SelectI/O technology. Additional I/O standards are supported, notably LVPECL, LVDS, and BLVDS, which use two pins per signal. Almost all signal pins can be used for these new standards.

Virtex-E devices have up to 640 Kb of faster (250 MHz) block SelectRAM, but the individual RAMs are the same size and structure as in the Virtex family. They also have eight DLLs instead of the four in Virtex devices. Each individual DLL is slightly improved with easier clock mirroring and 4x frequency multiplication.

V_{CCINT} , the supply voltage for the internal logic and memory, is 1.8 V, instead of 2.5 V for Virtex devices. Advanced processing and 0.18 μ m design rules have resulted in smaller dice, faster speed, and lower power consumption.

I/O pins are 3 V tolerant, and can be 5 V tolerant with an external 100 Ω resistor. PCI 5 V is not supported. With the addition of appropriate external resistors, any pin can tolerate any voltage desired.

Banking rules are different. With Virtex devices, all input buffers are powered by V_{CCINT} . With Virtex-E devices, the LVTTTL, LVCMOS2, and PCI input buffers are powered by the I/O supply voltage V_{CCO} .

The Virtex-E family is not bitstream-compatible with the Virtex family, but Virtex designs can be compiled into equivalent Virtex-E devices.

The same device in the same package for the Virtex-E and Virtex families are pin-compatible with some minor exceptions. See the data sheet pinout section for details.

General Description

The Virtex-E FPGA family delivers high-performance, high-capacity programmable logic solutions. Dramatic increases in silicon efficiency result from optimizing the new architecture for place-and-route efficiency and exploiting an aggressive 6-layer metal 0.18 μ m CMOS process. These advances make Virtex-E FPGAs powerful and flexible alternatives to mask-programmed gate arrays. The Virtex-E family includes the nine members in Table 1.

Building on experience gained from Virtex FPGAs, the Virtex-E family is an evolutionary step forward in programmable logic design. Combining a wide variety of programmable system features, a rich hierarchy of fast, flexible interconnect resources, and advanced process technology, the Virtex-E family delivers a high-speed and high-capacity programmable logic solution that enhances design flexibility while reducing time-to-market.

Virtex-E Architecture

Virtex-E devices feature a flexible, regular architecture that comprises an array of configurable logic blocks (CLBs) surrounded by programmable input/output blocks (IOBs), all interconnected by a rich hierarchy of fast, versatile routing

The register elements can be packed in the IOB using the IOB property to TRUE on the register or by using the “map-pr [ilolb]” where “i” is inputs only, “o” is outputs only and “b” is both inputs and outputs.

To improve design coding times VHDL and Verilog synthesis macro libraries have been developed to explicitly create these structures. The input library macros are listed below. The 3-state is configured to be 3-stated at GSR and when the PRE,CLR,S or R is asserted and shares its clock enable with the output register. If this is not desirable then the library can be updated by the user for the desired functionality. The O and OB inputs to the macros are the external net connections.

Creating a LVDS Bidirectional Buffer

LVDS bidirectional buffers can be placed in a wide number of IOB locations. The exact locations are dependent on the package used. The Virtex-E package information lists the possible locations as IO_L#P for the P-side and IO_L#N for the N-side, where # is the pair number.

HDL Instantiation

Both bidirectional buffers are required to be instantiated in the design and placed on the correct IO_L#P and IO_L#N locations. The IOB must have the same net source the following pins, clock (C), set/reset (SR), 3-state (T), 3-state clock enable (TCE), output (O), output clock enable (OCE). In addition, the output (O) pins must be inverted with respect to each other, and if output registers are used, the INIT states must be opposite values (one HIGH and one LOW). If 3-state registers are used, they must be initialized to the same state. Failure to follow these rules leads to DRC errors in the software.

VHDL Instantiation

```
data0_p: IOBUF_LVDS port map
(I=>data_out(0), T=>data_tri,
IO=>data_p(0), O=>data_int(0));
data0_inv: INV port map
(I=>data_out(0), O=>data_n_out(0));
data0_n : IOBUF_LVDS port map
(I=>data_n_out(0), T=>data_tri,
IO=>data_n(0), O=>open);
```

Verilog Instantiation

```
IOBUF_LVDS data0_p(.I(data_out[0]),
.T(data_tri), .IO(data_p[0]),
.O(data_int[0]));
INV data0_inv (.I(data_out[0]),
.O(data_n_out[0]));
IOBUF_LVDS
data0_n(.I(data_n_out[0]),.T(data_tri),.
IO(data_n[0]).O());
```

Location Constraints

All LVDS buffers must be explicitly placed on a device. For the output buffers this can be done with the following constraint in the .ucf or .ncf file.

```
NET data_p<0> LOC = D28; # IO_L0P
NET data_n<0> LOC = B29; # IO_L0N
```

Synchronous vs. Asynchronous Bidirectional Buffers

If the output side of the bidirectional buffers are synchronous (registered in the IOB), then any IO_L#PIN pair can be used. If the output side of the bidirectional buffers are asynchronous (no output register), then they must use one of the pairs that is a part of the asynchronous LVDS IOB group. This applies for either the 3-state pin or the data out pin.

The LVDS pairs that can be used as asynchronous bidirectional buffers are listed in the Virtex-E pinout tables. Some pairs are marked as asynchronous capable for all devices in that package, and others are marked as available only for that device in the package. If the device size might change at some point in the product's lifetime, then only the common pairs for all packages should be used.

Adding Output and 3-State Registers

All LVDS buffers can have an output and input registers in the IOB. The output registers must be in both the P-side and N-side IOBs, the input register is only in the P-side. All the normal IOB register options are available (FD, FDE, FDC, FDCE, FDP, FDPE, FDR, FDRE, FDS, FDSE, LD, LDE, LDC, LDCE, LDP, LDPE). The register elements can be inferred or explicitly instantiated in the HDL code. Special care must be taken to insure that the D pins of the registers are inverted and that the INIT states of the registers are opposite. The 3-state (T), 3-state clock enable (CE), clock pin (C), output clock enable (OCE), and set/reset (CLR/PRE or S/R) pins must connect to the same source. Failure to do this leads to a DRC error in the software.

The register elements can be packed in the IOB using the IOB property to TRUE on the register or by using the “map-pr [ilolb]” where “i” is inputs only, “o” is outputs only and “b” is both inputs and outputs. To improve design coding times VHDL and Verilog synthesis macro libraries have been developed to explicitly create these structures. The bidirectional I/O library macros are listed in Table 44. The 3-state is configured to be 3-stated at GSR and when the PRE,CLR,S or R is asserted and shares its clock enable with the output and input register. If this is not desirable then the library can be updated by the user for the desired functionality. The I/O and IOB inputs to the macros are the external net connections.

Calculation of $T_{i\text{oop}}$ as a Function of Capacitance

$T_{i\text{oop}}$ is the propagation delay from the O Input of the IOB to the pad. The values for $T_{i\text{oop}}$ are based on the standard capacitive load (C_{sl}) for each I/O standard as listed in [Table 3](#).

Table 3: Constants for Use in Calculation of $T_{i\text{oop}}$

Standard	Csl (pF)	fl (ns/pF)
LVTTL Fast Slew Rate, 2mA drive	35	0.41
LVTTL Fast Slew Rate, 4mA drive	35	0.20
LVTTL Fast Slew Rate, 6mA drive	35	0.13
LVTTL Fast Slew Rate, 8mA drive	35	0.079
LVTTL Fast Slew Rate, 12mA drive	35	0.044
LVTTL Fast Slew Rate, 16mA drive	35	0.043
LVTTL Fast Slew Rate, 24mA drive	35	0.033
LVTTL Slow Slew Rate, 2mA drive	35	0.41
LVTTL Slow Slew Rate, 4mA drive	35	0.20
LVTTL Slow Slew Rate, 6mA drive	35	0.10
LVTTL Slow Slew Rate, 8mA drive	35	0.086
LVTTL Slow Slew Rate, 12mA drive	35	0.058
LVTTL Slow Slew Rate, 16mA drive	35	0.050
LVTTL Slow Slew Rate, 24mA drive	35	0.048
LVCOS2	35	0.041
LVCOS18	35	0.050
PCI 33 MHZ 3.3 V	10	0.050
PCI 66 MHZ 3.3 V	10	0.033
GTL	0	0.014
GTL+	0	0.017
HSTL Class I	20	0.022
HSTL Class III	20	0.016
HSTL Class IV	20	0.014
SSTL2 Class I	30	0.028
SSTL2 Class II	30	0.016
SSTL3 Class I	30	0.029
SSTL3 Class II	30	0.016
CTT	20	0.035
AGP	10	0.037

Notes:

- I/O parameter measurements are made with the capacitance values shown above. See the application examples (in Module 2 of this data sheet) for appropriate terminations.
- I/O standard measurements are reflected in the IBIS model information except where the IBIS format precludes it.

For other capacitive loads, use the formulas below to calculate the corresponding $T_{i\text{oop}}$:

$$T_{i\text{oop}} = T_{i\text{oop}} + T_{\text{opadjust}} + (C_{\text{load}} - C_{sl}) * fl$$

where:

T_{opadjust} is reported above in the Output Delay Adjustment section.

C_{load} is the capacitive load for the design.

Table 4: Delay Measurement Methodology

Standard	V_L^1	V_H^1	Meas. Point	V_{REF} (Typ) ²
LVTTL	0	3	1.4	-
LVCOS2	0	2.5	1.125	-
PCI33_3	Per PCI Spec			-
PCI66_3	Per PCI Spec			-
GTL	$V_{REF} - 0.2$	$V_{REF} + 0.2$	V_{REF}	0.80
GTL+	$V_{REF} - 0.2$	$V_{REF} + 0.2$	V_{REF}	1.0
HSTL Class I	$V_{REF} - 0.5$	$V_{REF} + 0.5$	V_{REF}	0.75
HSTL Class III	$V_{REF} - 0.5$	$V_{REF} + 0.5$	V_{REF}	0.90
HSTL Class IV	$V_{REF} - 0.5$	$V_{REF} + 0.5$	V_{REF}	0.90
SSTL3 I & II	$V_{REF} - 1.0$	$V_{REF} + 1.0$	V_{REF}	1.5
SSTL2 I & II	$V_{REF} - 0.75$	$V_{REF} + 0.75$	V_{REF}	1.25
CTT	$V_{REF} - 0.2$	$V_{REF} + 0.2$	V_{REF}	1.5
AGP	$V_{REF} - (0.2 \times V_{CCO})$	$V_{REF} + (0.2 \times V_{CCO})$	V_{REF}	Per AGP Spec
LVDS	1.2 - 0.125	1.2 + 0.125	1.2	
LVPECL	1.6 - 0.3	1.6 + 0.3	1.6	

Notes:

- Input waveform switches between V_L and V_H .
- Measurements are made at V_{REF} (Typ), Maximum, and Minimum. Worst-case values are reported.
I/O parameter measurements are made with the capacitance values shown in [Table 3](#). See the application examples (in Module 2 of this data sheet) for appropriate terminations.
I/O standard measurements are reflected in the IBIS model information except where the IBIS format precludes it.

Clock Distribution Switching Characteristics

Description	Symbol	Speed Grade				Units
		Min	-8	-7	-6

FG680 Differential Pin Pairs

Virtex-E devices have differential pin pairs that can also provide other functions when not used as a differential pair. A \checkmark in the AO column indicates that the pin pair can be used as an asynchronous output for all devices provided in this package. Pairs with a note number in the AO column are device dependent. They can have asynchronous outputs if the pin pair are in the same CLB row and column in the device. Numbers in this column refer to footnotes that indicate which devices have pin pairs that can be asynchronous outputs. The Other Functions column indicates alternative function(s) not available when the pair is used as a differential pair or differential clock.

FG1156 Fine-Pitch Ball Grid Array Package

XCV1000E, XCV1600E, XCV2000E, XCV2600E, and XCV3200E devices in the FG1156 fine-pitch Ball Grid Array package have footprint compatibility. Pins labeled IO_VREF can be used as either V_{REF} or general I/O, unless indicated in the footnotes. If the pin is not used as V_{REF} , it can be used as general I/O. Immediately following [Table 28](#), see [Table 29](#) for Differential Pair information.

FG1156 Differential Pin Pairs

Virtex-E devices have differential pin pairs that can also provide other functions when not used as a differential pair. The AO column in [Table 29](#) indicates which devices in this package can use the pin pair as an asynchronous output. The “Other Functions” column indicates alternative function(s) that are not available when the pair is used as a differential pair or differential clock.

Table 29: FG1156 Differential Pin Pair Summary: XCV1000E, XCV1600E, XCV2000E, XCV2600E, XCV3200E
