Understanding [Embedded - FPGAs \(Field Programmable Gate Array\)](#)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

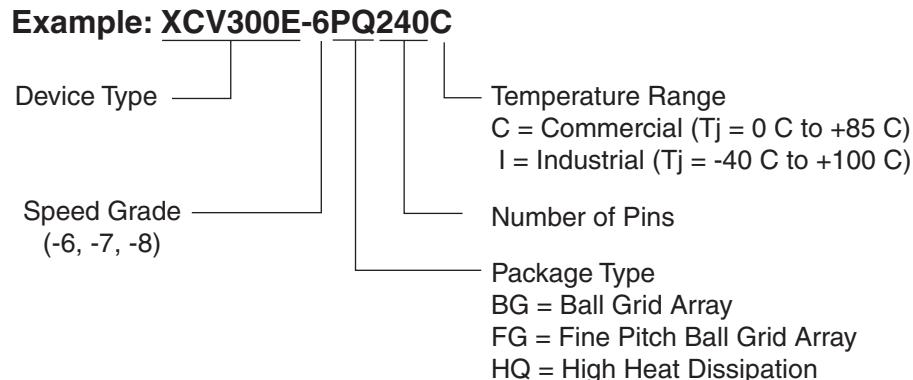

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

Details

Product Status	Obsolete
Number of LABs/CLBs	384
Number of Logic Elements/Cells	1728
Total RAM Bits	65536
Number of I/O	158
Number of Gates	71693
Voltage - Supply	1.71V ~ 1.89V
Mounting Type	Surface Mount
Operating Temperature	-40°C ~ 100°C (TJ)
Package / Case	240-BFQFP
Supplier Device Package	240-PQFP (32x32)
Purchase URL	https://www.e-xfl.com/product-detail/xilinx/xcv50e-6pq240i

Virtex-E Ordering Information

DS022_043_072000

Figure 1: Ordering Information

Revision History

The following table shows the revision history for this document.

Date	Version	Revision
12/7/99	1.0	Initial Xilinx release.
1/10/00	1.1	Re-released with spd.txt v. 1.18, FG860/900/1156 package information, and additional DLL, Select RAM and SelectI/O information.
1/28/00	1.2	Added Delay Measurement Methodology table, updated SelectI/O section, Figures 30, 54, & 55, text explaining Table 5, T_{BYP} values, buffered Hex Line info, p. 8, I/O Timing Measurement notes, notes for Tables 15, 16, and corrected F1156 pinout table footnote references.
2/29/00	1.3	Updated pinout tables, V_{CC} page 20, and corrected Figure 20.
5/23/00	1.4	Correction to table on p. 22.
7/10/00	1.5	<ul style="list-style-type: none"> • Numerous minor edits. • Data sheet upgraded to Preliminary. • Preview -8 numbers added to Virtex-E Electrical Characteristics tables.
8/1/00	1.6	<ul style="list-style-type: none"> • Reformatted entire document to follow new style guidelines. • Changed speed grade values in tables on pages 35-37.
9/20/00	1.7	<ul style="list-style-type: none"> • Min values added to Virtex-E Electrical Characteristics tables. • XCV2600E and XCV3200E numbers added to Virtex-E Electrical Characteristics tables (Module 3). • Corrected user I/O count for XCV100E device in Table 1 (Module 1). • Changed several pins to "No Connect in the XCV100E" and removed duplicate V_{CCINT} pins in Table ~ (Module 4). • Changed pin J10 to "No connect in XCV600E" in Table 74 (Module 4). • Changed pin J30 to "VREF option only in the XCV600E" in Table 74 (Module 4). • Corrected pair 18 in Table 75 (Module 4) to be "AO in the XCV1000E, XCV1600E".

forces a storage element into the initialization state specified for it in the configuration. BY forces it into the opposite state. Alternatively, these signals can be configured to operate asynchronously. All of the control signals are independently invertible, and are shared by the two flip-flops within the slice.

Additional Logic

The F5 multiplexer in each slice combines the function generator outputs. This combination provides either a function generator that can implement any 5-input function, a 4:1 multiplexer, or selected functions of up to nine inputs.

Similarly, the F6 multiplexer combines the outputs of all four function generators in the CLB by selecting one of the F5-multiplexer outputs. This permits the implementation of any 6-input function, an 8:1 multiplexer, or selected functions of up to 19 inputs.

Each CLB has four direct feedthrough paths, two per slice. These paths provide extra data input lines or additional local routing that does not consume logic resources.

Arithmetic Logic

Dedicated carry logic provides fast arithmetic carry capability for high-speed arithmetic functions. The Virtex-E CLB supports two separate carry chains, one per Slice. The height of the carry chains is two bits per CLB.

The arithmetic logic includes an XOR gate that allows a 2-bit full adder to be implemented within a slice. In addition, a dedicated AND gate improves the efficiency of multiplier implementation. The dedicated carry path can also be used to cascade function generators for implementing wide logic functions.

BUFTs

Each Virtex-E CLB contains two 3-state drivers (BUFTs) that can drive on-chip buses. See **Dedicated Routing**. Each Virtex-E BUFT has an independent 3-state control pin and an independent input pin.

Block SelectRAM

Virtex-E FPGAs incorporate large block SelectRAM memories. These complement the Distributed SelectRAM memories that provide shallow RAM structures implemented in CLBs.

Block SelectRAM memory blocks are organized in columns, starting at the left (column 0) and right outside edges and inserted every 12 CLB columns (see notes for smaller devices). Each memory block is four CLBs high, and each memory column extends the full height of the chip, immediately adjacent (to the right, except for column 0) of the CLB column locations indicated in **Table 3**.

Table 3: CLB/Block RAM Column Locations

XCV Device /Col.	0	12	24	36	48	60	72	84	96	108	120	138	156
50E	Columns 0, 6, 18, & 24												
100E	Columns 0, 12, 18, & 30												
200E	Columns 0, 12, 30, & 42												
300E	✓	✓		✓	✓								
400E	✓	✓			✓	✓							
600E	✓	✓	✓		✓	✓	✓						
1000E	✓	✓	✓				✓	✓	✓				
1600E	✓	✓	✓	✓			✓	✓	✓	✓			
2000E	✓	✓	✓	✓				✓	✓	✓	✓		
2600E	✓	✓	✓	✓					✓	✓	✓	✓	
3200E	✓	✓	✓	✓						✓	✓	✓	✓

Table 4 shows the amount of block SelectRAM memory that is available in each Virtex-E device.

Table 4: Virtex-E Block SelectRAM Amounts

Virtex-E Device	# of Blocks	Block SelectRAM Bits
XCV50E	16	65,536
XCV100E	20	81,920
XCV200E	28	114,688
XCV300E	32	131,072
XCV400E	40	163,840
XCV600E	72	294,912
XCV1000E	96	393,216
XCV1600E	144	589,824
XCV2000E	160	655,360
XCV2600E	184	753,664
XCV3200E	208	851,968

As illustrated in **Figure 6**, each block SelectRAM cell is a fully synchronous dual-ported (True Dual Port) 4096-bit RAM with independent control signals for each port. The data widths of the two ports can be configured independently, providing built-in bus-width conversion.

Using SelectI/O

The Virtex-E FPGA series includes a highly configurable, high-performance I/O resource, called SelectI/O™ to provide support for a wide variety of I/O standards. The SelectI/O resource is a robust set of features including programmable control of output drive strength, slew rate, and input delay and hold time. Taking advantage of the flexibility and SelectI/O features and the design considerations described in this document can improve and simplify system level design.

Introduction

As FPGAs continue to grow in size and capacity, the larger and more complex systems designed for them demand an increased variety of I/O standards. Furthermore, as system clock speeds continue to increase, the need for high performance I/O becomes more important.

While chip-to-chip delays have an increasingly substantial impact on overall system speed, the task of achieving the desired system performance becomes more difficult with the proliferation of low-voltage I/O standards. SelectI/O, the revolutionary input/output resources of Virtex-E devices, resolve this potential problem by providing a highly configurable, high-performance alternative to the I/O resources of more conventional programmable devices. Virtex-E SelectI/O features combine the flexibility and time-to-market advantages of programmable logic with the high performance previously available only with ASICs and custom ICs.

Each SelectI/O block can support up to 20 I/O standards. Supporting such a variety of I/O standards allows the support of a wide variety of applications, from general purpose standard applications to high-speed low-voltage memory buses.

SelectI/O blocks also provide selectable output drive strengths and programmable slew rates for the LVTTL output buffers, as well as an optional, programmable weak pull-up, weak pull-down, or weak “keeper” circuit ideal for use in external bussing applications.

Each Input/Output Block (IOB) includes three registers, one each for the input, output, and 3-state signals within the IOB. These registers are optionally configurable as either a D-type flip-flop or as a level sensitive latch.

The input buffer has an optional delay element used to guarantee a zero hold time requirement for input signals registered within the IOB.

The Virtex-E SelectI/O features also provide dedicated resources for input reference voltage (V_{REF}) and output source voltage (V_{CCO}), along with a convenient banking system that simplifies board design.

By taking advantage of the built-in features and wide variety of I/O standards supported by the SelectI/O features, system-level design and board design can be greatly simplified and improved.

Termination Resistor Packs

Resistor packs are available with the values and the configuration required for LVDS and LVPECL termination from Bourns, Inc., as listed in Table. For pricing and availability, please contact Bourns directly at <http://www.bourns.com>.

Table 40: Bourns LVDS/LVPECL Resistor Packs

Part Number	I/O Standard	Term. for:	Pairs/Pack	Pins
CAT16-LV2F6	LVDS	Driver	2	8
CAT16-LV4F12	LVDS	Driver	4	16
CAT16-PC2F6	LVPECL	Driver	2	8
CAT16-PC4F12	LVPECL	Driver	4	16
CAT16-PT2F2	LVDS/LVPECL	Receiver	2	8
CAT16-PT4F4	LVDS/LVPECL	Receiver	4	16

LVDS Design Guide

The SelectI/O library elements have been expanded for Virtex-E devices to include new LVDS variants. At this time all of the cells might not be included in the Synthesis libraries. The 2.1i-Service Pack 2 update for Alliance and Foundation software includes these cells in the VHDL and Verilog libraries. It is necessary to combine these cells to create the P-side (positive) and N-side (negative) as described in the input, output, 3-state and bidirectional sections.

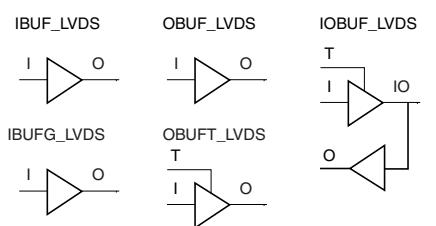

Figure 58: LVDS elements

Creating LVDS Global Clock Input Buffers

Global clock input buffers can be combined with adjacent IOBs to form LVDS clock input buffers. P-side is the GCLKPAD location; N-side is the adjacent IO_LVDS_DLL site.

Table 41: Global Clock Input Buffer Pair Locations

Pkg	GCLK 3		GCLK 2		GCLK 1		GCLK 0	
	P	N	P	N	P	N	P	N

BG560	A17	C18	D17	E17	AJ17	AM18	AL17	AM17
FG256	B8	A7	C9	A8	R8	T8	N8	N9
FG456	C11	B11	A11	D11	YII	AA11	W12	U12
FG676	E13	B13	C13	F14	AB13	AF13	AA14	AC14
FG680	A20	C22	D21	A19	AU22	AT22	AW19	AT21
FG860	C22	A22	B22	D22	AY22	AW21	BA22	AW20
FG900	C15	A15	E15	E16	AK16	AH16	AJ16	AF16
FG1156	E17	C17	D17	J18	AI19	AL17	AH18	AM18

HDL Instantiation

Only one global clock input buffer is required to be instantiated in the design and placed on the correct GCLKPAD location. The N-side of the buffer is reserved and no other IOB is allowed to be placed on this location.

In the physical device, a configuration option is enabled that routes the pad wire to the differential input buffer located in the GCLKIOB. The output of this buffer then drives the output of the GCLKIOB cell. In EPIC it appears that the second buffer is unused. Any attempt to use this location for another purpose leads to a DRC error in the software.

VHDL Instantiation

```
gclk0_p : IBUFG_LVDS port map
(I=>clk_external, O=>clk_internal);
```

Verilog Instantiation

```
IBUFG_LVDS gclk0_p (.I(clk_external),
.O(clk_internal));
```

Location constraints

All LVDS buffers must be explicitly placed on a device. For the global clock input buffers this can be done with the following constraint in the .ucf or .ncf file.

```
NET clk_external LOC = GCLKPAD3;
```

GCLKPAD3 can also be replaced with the package pin name such as D17 for the BG432 package.

Optional N-side

Some designers might prefer to also instantiate the N-side buffer for the global clock buffer. This allows the top-level net list to include net connections for both PCB layout and system-level integration. In this case, only the output P-side IBUFG connection has a net connected to it. Since the N-side IBUFG does not have a connection in the EDIF net list, it is trimmed from the design in MAP.

VHDL Instantiation

```
gclk0_p : IBUFG_LVDS port map
(I=>clk_p_external, O=>clk_internal);
gclk0_n : IBUFG_LVDS port map
(I=>clk_n_external, O=>clk_internal);
```

Verilog Instantiation

```
IBUFG_LVDS gclk0_p (.I(clk_p_external),
.O(clk_internal));
IBUFG_LVDS gclk0_n (.I(clk_n_external),
.O(clk_internal));
```

Location Constraints

All LVDS buffers must be explicitly placed on a device. For the global clock input buffers this can be done with the following constraint in the .ucf or .ncf file.

```
NET clk_p_external LOC = GCLKPAD3;
NET clk_n_external LOC = C17;
```

GCLKPAD3 can also be replaced with the package pin name, such as D17 for the BG432 package.

Creating LVDS Input Buffers

An LVDS input buffer can be placed in a wide number of IOB locations. The exact location is dependent on the package that is used. The Virtex-E package information lists the possible locations as IO_L#P for the P-side and IO_L#N for the N-side where # is the pair number.

HDL Instantiation

Only one input buffer is required to be instantiated in the design and placed on the correct IO_L#P location. The N-side of the buffer is reserved and no other IOB is allowed to be placed on this location. In the physical device, a configuration option is enabled that routes the pad wire from the IO_L#N IOB to the differential input buffer located in the IO_L#P IOB. The output of this buffer then drives the output of the IO_L#P cell or the input register in the IO_L#P IOB. In EPIC it appears that the second buffer is unused. Any attempt to use this location for another purpose leads to a DRC error in the software.

VHDL Instantiation

```
data0_p : IBUF_LVDS port map (I=>data(0),
O=>data_int(0));
```

Verilog Instantiation

```
IBUF_LVDS data0_p (.I(data[0]),
.O(data_int[0]));
```

Location Constraints

All LVDS buffers must be explicitly placed on a device. For the input buffers this can be done with the following constraint in the .ucf or .ncf file.

```
NET data<0> LOC = D28; # IO_L0P
```

Optional N-side

Some designers might prefer to also instantiate the N-side buffer for the input buffer. This allows the top-level net list to include net connections for both PCB layout and system-level integration. In this case, only the output P-side IBUF connection has a net connected to it. Since the N-side IBUF does not have a connection in the EDIF net list, it is trimmed from the design in MAP.

VHDL Instantiation

```
data0_p : IBUF_LVDS port map
(I=>data_p(0), O=>data_int(0));
data0_n : IBUF_LVDS port map
(I=>data_n(0), O=>open);
```

Verilog Instantiation

```
IBUF_LVDS data0_p (.I(data_p[0]),
.O(data_int[0]));
IBUF_LVDS data0_n (.I(data_n[0]), .O());
```

Location Constraints

All LVDS buffers must be explicitly placed on a device. For the global clock input buffers this can be done with the following constraint in the .ucf or .ncf file.

```
NET data_p<0> LOC = D28; # IO_L0P
```

```
NET data_n<0> LOC = B29; # IO_L0N
```

Adding an Input Register

All LVDS buffers can have an input register in the IOB. The input register is in the P-side IOB only. All the normal IOB register options are available (FD, FDE, FDC, FDCE, FDP, FDPE, FDR, FDRE, FDS, FDSE, LD, LDE, LDC, LDCE, LDP, LDPE). The register elements can be inferred or explicitly instantiated in the HDL code.

The register elements can be packed in the IOB using the IOB property to TRUE on the register or by using the “map -pr [ilob]” where “i” is inputs only, “o” is outputs only and “b” is both inputs and outputs.

To improve design coding times VHDL and Verilog synthesis macro libraries available to explicitly create these structures. The input library macros are listed in [Table 42](#). The I and IB inputs to the macros are the external net connections.

Virtex-E Pin Definitions

Pin Name	Dedicated Pin	Direction	Description
GCK0, GCK1, GCK2, GCK3	Yes	Input	Clock input pins that connect to Global Clock Buffers.
M0, M1, M2	Yes	Input	Mode pins are used to specify the configuration mode.
CCLK	Yes	Input or Output	The configuration Clock I/O pin: it is an input for SelectMAP and slave-serial modes, and output in master-serial mode. After configuration, it is input only, logic level = Don't Care.
PROGRAM	Yes	Input	Initiates a configuration sequence when asserted Low.
DONE	Yes	Bidirectional	Indicates that configuration loading is complete, and that the start-up sequence is in progress. The output can be open drain.
INIT	No	Bidirectional (Open-drain)	When Low, indicates that the configuration memory is being cleared. The pin becomes a user I/O after configuration.
BUSY/DOUT	No	Output	In SelectMAP mode, BUSY controls the rate at which configuration data is loaded. The pin becomes a user I/O after configuration unless the SelectMAP port is retained. In bit-serial modes, DOUT provides preamble and configuration data to downstream devices in a daisy-chain. The pin becomes a user I/O after configuration.
D0/DIN, D1, D2, D3, D4, D5, D6, D7	No	Input or Output	In SelectMAP mode, D0-7 are configuration data pins. These pins become user I/Os after configuration unless the SelectMAP port is retained. In bit-serial modes, DIN is the single data input. This pin becomes a user I/O after configuration.
WRITE	No	Input	In SelectMAP mode, the active-low Write Enable signal. The pin becomes a user I/O after configuration unless the SelectMAP port is retained.
CS	No	Input	In SelectMAP mode, the active-low Chip Select signal. The pin becomes a user I/O after configuration unless the SelectMAP port is retained.
TDI, TDO, TMS, TCK	Yes	Mixed	Boundary-scan Test-Access-Port pins, as defined in IEEE1149.1.
DXN, DXP	Yes	N/A	Temperature-sensing diode pins. (Anode: DXP, cathode: DXN)
V _{CCINT}	Yes	Input	Power-supply pins for the internal core logic.
V _{CCO}	Yes	Input	Power-supply pins for the output drivers (subject to banking rules)
V _{REF}	No	Input	Input threshold voltage pins. Become user I/Os when an external threshold voltage is not needed (subject to banking rules).
GND	Yes	Input	Ground

Low Voltage Differential Signals

The Virtex-E family incorporates low-voltage signalling (LVDS and LVPECL). Two pins are utilized for these signals to be connected to a Virtex-E device. These are known as differential pin pairs. Each differential pin pair has a Positive (P) and a Negative (N) pin. These pairs are labeled in the following manner.

IO_L#[P/N]

where

L = LVDS or LVPECL pin

= Pin Pair Number

P = Positive

N = Negative

I/O pins for differential signals can either be synchronous or asynchronous, input or output. The pin pairs can be used for synchronous input and output signals as well as asynchronous input signals. However, only some of the low-voltage pairs can be used for asynchronous output signals.

Differential signals require the pins of a pair to switch almost simultaneously. If the signals driving the pins are from IOB flip-flops, they are synchronous. If the signals driving the pins are from internal logic, they are asynchronous. **Table 2** defines the names and function of the different types of low-voltage pin pairs in the Virtex-E family.

Table 2: LVDS Pin Pairs

Pin Name	Description
IO_L#[P/N]	Represents a general IO or a synchronous input/output differential signal. When used as a differential signal, N means Negative I/O and P means Positive I/O. Example: IO_L22N
IO_L#[P/N]_Y	Represents a general IO or a synchronous input/output differential signal, or a part-dependent asynchronous output differential signal. Example: IO_L22N_Y
IO_L#[P/N]_YY	Represents a general IO or a synchronous input/output differential signal, or an asynchronous output differential signal. Example: O_L22N_YY
IO_LVDS_DLL_L#[P/N]	Represents a general IO or a synchronous input/output differential signal, a differential clock input signal, or a DLL input. When used as a differential clock input, this pin is paired with the adjacent GCK pin. The GCK pin is always the positive input in the differential clock input configuration. Example: IO_LVDS_DLL_L16N

Virtex-E Package Pinouts

The Virtex-E family of FPGAs is available in 12 popular packages, including chip-scale, plastic and high heat-dissipation quad flat packs, and ball grid and fine-pitch ball grid arrays. Family members have footprint compatibility across devices provided in the same package. The pinout tables in

this section indicate function, pin, and bank information for each package/device combination. Following each pinout table is an additional table summarizing information specific to differential pin pairs for all devices provided in that package.

FG860 Fine-Pitch Ball Grid Array Package

XCV1000E, XCV1600E, and XCV2000E devices in the FG860 fine-pitch Ball Grid Array package have footprint compatibility. Pins labeled IO_VREF can be used as either in all parts unless device-dependent as indicated in the footnotes. If the pin is not used as V_{REF} , it can be used as general I/O. Immediately following Table 24, see Table 25 for Differential Pair information.
