Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Slave-Serial Mode

In slave-serial mode, the FPGA receives configuration data in bit-serial form from a serial PROM or other source of serial configuration data. The serial bitstream must be set up at the DIN input pin a short time before each rising edge of an externally generated CCLK.

For more detailed information on serial PROMs, see the PROM data sheet at **http://www.xilinx.com/bvdocs/publications/ds026.pdf**.

Multiple FPGAs can be daisy-chained for configuration from a single source. After a particular FPGA has been configured, the data for the next device is routed to the DOUT pin. The maximum capacity for a single LOUT/DOUT write is 2^{20}-1 (1,048,575) 32-bit words, or 33,554,4000 bits. The data on the DOUT pin changes on the rising edge of CCLK.

The change of DOUT on the rising edge of CCLK differs from previous families, but does not cause a problem for mixed configuration chains. This change was made to improve serial configuration rates for Virtex and Virtex-E only chains.

Figure 13 shows a full master/slave system. A Virtex-E device in slave-serial mode should be connected as shown in the right-most device.

Slave-serial mode is selected by applying <111> or <011> to the mode pins (M2, M1, M0). A weak pull-up on the mode pins makes slave serial the default mode if the pins are left unconnected. However, it is recommended to drive the configuration mode pins externally. Figure 14 shows slave-serial mode programming switching characteristics.

Table 10 provides more detail about the characteristics shown in Figure 14. Configuration must be delayed until the $\overline{\text{INIT}}$ pins of all daisy-chained FPGAs are High.

Pinout Differences Between Virtex and Virtex-E Families

The same device in the same package for the Virtex-E and Virtex families are pin-compatible with some minor exceptions, listed in Table 1.

XCV200E Device, FG456 Package

The Virtex-E XCV200E has two I/O pins swapped with the Virtex XCV200 to accommodate differential clock pairing.

XCV400E Device, FG676 Package

The Virtex-E XCV400E has two I/O pins swapped with the Virtex XCV400 to accommodate differential clock pairing.

All Devices, PQ240 and HQ240 Packages

The Virtex devices in PQ240 and HQ240 packages do not have V_{CCO} banking, but Virtex-E devices do. To achieve this, eight Virtex I/O pins (P232, P207, P176, P146, P116, P85, P55, and P25) are now VCCO pins in the Virtex-E family. This change also requires one Virtex I/O or VREF pin to be swapped with a standard I/O pin.

Additionally, accommodating differential clock input pairs in Virtex-E caused some IO_V_{REF} differences in the XCV400E and XCV600E devices only. Virtex IO_V_{REF} pins P215 and P87 are Virtex-E IO_V_{REF} pins P216 and P86, respectively. Virtex-E pins P215 and P87 are IO_DLL.

BG352 Ball Grid Array Packages

XCV100E, XCV200E, and XCV300E devices in BG352 Ball Grid Array packages have footprint compatibility. Pins labeled I0_VREF can be used as either in all parts unless device-dependent as indicated in the footnotes. If the pin is not used as V_{REF}, it can be used as general I/O. Immediately following Table 10, see Table 11 for Differential Pair information.

FG456 Differential Pin Pairs

Virtex-E devices have differential pin pairs that can also provide other functions when not used as a differential pair. A √ in the AO column indicates that the pin pair can be used as an asynchronous output for all devices provided in this package. Pairs with a note number in the AO column are device dependent. They can have asynchronous outputs if the pin pair are in the same CLB row and column in the device. Numbers in this column refer to footnotes that indicate which devices have pin pairs than can be asynchronous outputs. The Other Functions column indicates alternative function(s) not available when the pair is used as a differential pair or differential clock.

FG900 Fine-Pitch Ball Grid Array Package

XCV600E, XCV1000E, and XCV1600E devices in the FG900 fine-pitch Ball Grid Array package have footprint compatibility. Pins labeled I0_VREF can be used as either in all parts unless device-dependent as indicated in the footnotes. If the pin is not used as V_{REF}, it can be used as general I/O. Immediately following Table 26, see Table 27 for Differential Pair information.
