### Understanding [Embedded - FPGAs \(Field Programmable Gate Array\)](#)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

### Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

		V <sub>CCO</sub> = 2.5V ± 10%	LVDS_25, MINI_LVDS_25, RSDS_25	90	110	—	—	Ω

### Notes:

- The numbers in this table are based on the conditions set forth in Table 8.
- For single-ended signals that are placed on a differential-capable I/O, V<sub>IN</sub> of -0.2V to -0.5V is supported but can cause increased leakage between the two pins. See "Parasitic Leakage" in [UG331, Spartan-3 Generation FPGA User Guide](#).
- This parameter is based on characterization. The pull-up resistance R<sub>PU</sub> = V<sub>CCO</sub> / I<sub>RPU</sub>. The pull-down resistance R<sub>PD</sub> = V<sub>IN</sub> / I<sub>RPD</sub>.

		XC3S200A	5	12	15	mA
		XC3S400A	5	18	24	mA
		XC3S700A	6	28	34	mA
		XC3S1400A	10	50	58	mA

**Notes:**

1. The numbers in this table are based on the conditions set forth in [Table 8](#).
2. Quiescent supply current is measured with all I/O drivers in a high-impedance state and with all pull-up/pull-down resistors at the I/O pads disabled. Typical values are characterized using typical devices at room temperature ( $T_J$  of 25°C at  $V_{CCINT} = 1.2V$ ,  $V_{CCO} = 3.3V$ , and  $V_{CCAUX} = 2.5V$ ). The maximum limits are tested for each device at the respective maximum specified junction temperature and at maximum voltage limits with  $V_{CCINT} = 1.26V$ ,  $V_{CCO} = 3.6V$ , and  $V_{CCAUX} = 3.6V$ . The FPGA is programmed with a “blank” configuration data file (that is, a design with no functional elements instantiated). For conditions other than those described above (for example, a design including functional elements), measured quiescent current levels will be different than the values in the table.
3. For more accurate estimates for a specific design, use the Xilinx XPower tools. There are two recommended ways to estimate the total power consumption (quiescent plus dynamic) for a specific design: a) The [Spartan-3A FPGA XPower Estimator](#) provides quick, approximate, typical estimates, and does not require a netlist of the design. b) XPower Analyzer uses a netlist as input to provide maximum estimates as well as more accurate typical estimates.
4. The maximum numbers in this table indicate the minimum current each power rail requires in order for the FPGA to power-on successfully.
5. For information on the power-saving Suspend mode, see [XAPP480: Using Suspend Mode in Spartan-3 Generation FPGAs](#). Suspend mode typically saves 40% total power consumption compared to quiescent current.

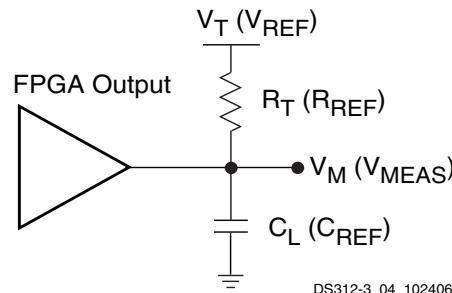

## Timing Measurement Methodology

When measuring timing parameters at the programmable I/Os, different signal standards call for different test conditions. [Table 27](#) lists the conditions to use for each standard.

The method for measuring Input timing is as follows: A signal that swings between a Low logic level of  $V_L$  and a High logic level of  $V_H$  is applied to the Input under test. Some standards also require the application of a bias voltage to the  $V_{REF}$  pins of a given bank to properly set the input-switching threshold. The measurement point of the Input signal ( $V_M$ ) is commonly located halfway between  $V_L$  and  $V_H$ .

The Output test setup is shown in [Figure 9](#). A termination voltage  $V_T$  is applied to the termination resistor  $R_T$ , the other end of which is connected to the Output. For each standard,  $R_T$  and  $V_T$  generally take on the standard values recommended for minimizing signal reflections. If the standard does not ordinarily use terminations (for example,

LVCMS, LVTT), then  $R_T$  is set to  $1M\Omega$  to indicate an open connection, and  $V_T$  is set to zero. The same measurement point ( $V_M$ ) that was used at the Input is also used at the Output.

### Notes:

1. The names shown in parentheses are used in the IBIS file.

Table 57: Types of Pins on Spartan-3A FPGAs(Continued)

Type / Color Code	Description	Pin Name(s) in Type
PWR MGMT	Control and status pins for the power-saving Suspend mode. SUSPEND is a dedicated pin and is powered by V <sub>CCAUX</sub> . AWAKE is a dual-purpose pin. Unless Suspend mode is enabled in the application, AWAKE is available as a user-I/O pin.	SUSPEND, AWAKE
JTAG	Dedicated JTAG pin - 4 per device. Not available as a user-I/O pin. Every package has four dedicated JTAG pins. These pins are powered by V <sub>CCAUX</sub> .	TDI, TMS, TCK, TDO
GND	Dedicated ground pin. The number of GND pins depends on the package used. All must be connected.	GND
V <sub>CCAUX</sub>	Dedicated auxiliary power supply pin. The number of V <sub>CCAUX</sub> pins depends on the package used. All must be connected. V <sub>CCAUX</sub> can be either 2.5V or 3.3V. Set on board and using CONFIG V <sub>CCAUX</sub> constraint.	V <sub>CCAUX</sub>
V <sub>CINT</sub>	Dedicated internal core logic power supply pin. The number of V <sub>CINT</sub> pins depends on the package used. All must be connected to +1.2V.	V <sub>CINT</sub>
V <sub>CCO</sub>	Along with all the other V <sub>CCO</sub> pins in the same bank, this pin supplies power to the output buffers within the I/O bank and sets the input threshold voltage for some I/O standards. All must be connected.	V <sub>CCO</sub> _#
N.C.	This package pin is not connected in this specific device/package combination but may be connected in larger devices in the same package.	N.C.

**Notes:**

- # = I/O bank number, an integer between 0 and 3.

## Package Pins by Type

Each package has three separate voltage supply inputs—V<sub>CINT</sub>, V<sub>CCAUX</sub>, and V<sub>CCO</sub>—and a common ground return, GND. The numbers of pins dedicated to these functions vary by package, as shown in Table 58.

Table 58: Power and Ground Supply Pins by Package

Package	V <sub>CINT</sub>	V <sub>CCAUX</sub>	V <sub>CCO</sub>	GND
VQ100	4	3	6	13
TQ144	4	4	8	13
FT256 (50A/200A/400A)	6	4	16	28

FG400	9	8	22	43
FG484	15	10	24	53
FG676	23	14	36	77

A majority of package pins are user-defined I/O or input pins. However, the numbers and characteristics of these I/O depend on the device type and the package in which it is available, as shown in Table 59. The table shows the maximum number of single-ended I/O pins available, assuming that all I/O-, INPUT-, DUAL-, VREF-, and CLK-type pins are used as general-purpose I/O. AWAKE is counted here as a dual-purpose I/O pin. Likewise, the table shows the maximum number of differential pin-pairs available on the package. Finally, the table shows how the total maximum user-I/Os are distributed by pin type, including the number of unconnected—N.C.—pins on the device.

Not all I/O standards are supported on all I/O banks. The left and right banks (I/O banks 1 and 3) support higher output drive current than the top and bottom banks (I/O banks 0 and 2). Similarly, true differential output standards, such as LVDS, RSDS, PPDS, miniLVDS, and TMDS, are only supported in the top or bottom banks (I/O banks 0 and 2). Inputs are unrestricted. For more details, see the chapter “Using I/O Resources” in [UG331](#).

**Notes:**

- Some VREFs are on INPUT pins. See pinout tables for details.

Electronic versions of the package pinout tables and footprints are available for download from the Xilinx website. Using a spreadsheet program, the data can be sorted and reformatted according to any specific needs. Similarly, the ASCII-text file is easily parsed by most scripting programs.

## FG676: 676-ball Fine-pitch Ball Grid Array

The 676-ball fine-pitch ball grid array, FG676, supports the XC3S1400A FPGA.

**Table 87** lists all the FG676 package pins. They are sorted by bank number and then by pin name. Pairs of pins that form a differential I/O pair appear together in the table. The table also shows the pin number for each pin and the pin type, as defined earlier.

The XC3S1400A has 17 unconnected balls, indicated as N.C. (No Connection) in **Table 87** and with the black diamond character (◆) in **Table 87** and **Figure 27**.

An electronic version of this package pinout table and footprint diagram is available for download from the Xilinx website at:

[www.xilinx.com/support/documentation/data\\_sheets/s3a\\_pin.zip](http://www.xilinx.com/support/documentation/data_sheets/s3a_pin.zip).
