Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details	
Product Status	Active
Number of LABs/CLBs	448
Number of Logic Elements/Cells	4032
Total RAM Bits	294912
Number of I/O	68
Number of Gates	200000
Voltage - Supply	1.14V ~ 1.26V
Mounting Type	Surface Mount
Operating Temperature	-40°C ~ 100°C (TJ)
Package / Case	100-TQFP
Supplier Device Package	100-VQFP (14x14)

Configuration

Spartan-3A FPGAs are programmed by loading configuration data into robust, reprogrammable, static CMOS configuration latches (CCLs) that collectively control all functional elements and routing resources. The FPGA's configuration data is stored externally in a PROM or some other non-volatile medium, either on or off the board. After applying power, the configuration data is written to the FPGA using any of seven different modes:

- Master Serial from a Xilinx Platform Flash PROM
- Serial Peripheral Interface (SPI) from an industry-standard SPI serial Flash
- Byte Peripheral Interface (BPI) Up from an industry-standard x8 or x8/x16 parallel NOR Flash
- Slave Serial, typically downloaded from a processor
- Slave Parallel, typically downloaded from a processor
- Boundary Scan (JTAG), typically downloaded from a processor or system tester

Furthermore, Spartan-3A FPGAs support MultiBoot configuration, allowing two or more FPGA configuration bitstreams to be stored in a single SPI serial Flash or a BPI parallel NOR Flash. The FPGA application controls which configuration to load next and when to load it.

Additionally, each Spartan-3A FPGA contains a unique, factory-programmed Device DNA identifier useful for tracking purposes, anti-cloning designs, or IP protection.

I/O Capabilities

The Spartan-3A FPGA SelectIO interface supports many popular single-ended and differential standards. Table 2 shows the number of user I/Os as well as the number of differential I/O pairs available for each device/package combination. Some of the user I/Os are unidirectional input-only pins as indicated in Table 2.

Spartan-3A FPGAs support the following single-ended standards:

- 3.3V low-voltage TTL (LVTTL)
- Low-voltage CMOS (LVCMOS) at 3.3V, 2.5V, 1.8V, 1.5V, or 1.2V
- 3.3V PCI at 33 MHz or 66 MHz
- HSTL I, II, and III at 1.5V and 1.8V, commonly used in memory applications
- SSTL I and II at 1.8V, 2.5V, and 3.3V, commonly used for memory applications

Spartan-3A FPGAs support the following differential standards:

- LVDS, mini-LVDS, RSDS, and PPDS I/O at 2.5V or 3.3V
- Bus LVDS I/O at 2.5V
- TMDS I/O at 3.3V
- Differential HSTL and SSTL I/O
- LVPECL inputs at 2.5V or 3.3V

Notes:

1. The number shown in **bold** indicates the maximum number of I/O and input-only pins. The number shown in (*italics*) indicates the number of input-only pins. The differential (Diff) input-only pin count includes both differential pairs on input-only pins and differential pairs on I/O pins within I/O banks that are restricted to differential inputs.
2. The footprints for the VQ/TQ packages are larger than the package body. See the Package Drawings for details.

Production Status

Table 3 indicates the production status of each Spartan-3A FPGA by temperature range and speed grade. The table also lists the earliest speed file version required for creating a production configuration bitstream. Later versions are also supported.

Table 3: **Spartan-3A FPGA Production Status (Production Speed File)**

Package Marking

Figure 2 provides a top marking example for Spartan-3A FPGAs in the quad-flat packages. Figure 3 shows the top marking for Spartan-3A FPGAs in BGA packages. The markings for the BGA packages are nearly identical to those for the quad-flat packages, except that the marking is rotated with respect to the ball A1 indicator.

The "5C" and "4I" Speed Grade/Temperature Range part combinations may be dual marked as "5C/4I". Devices with a single mark are only guaranteed for the marked speed grade and temperature range.

Notes:

1. The numbers in this table are based on the conditions set forth in Table 8 and Table 11.
2. Descriptions of the symbols used in this table are as follows:
   I_{OL} — the output current condition under which V_{OL} is tested
   I_{OH} — the output current condition under which V_{OH} is tested
   V_{OL} — the output voltage that indicates a Low logic level
   V_{OH} — the output voltage that indicates a High logic level
   V_{CCO} — the supply voltage for output drivers
   V_{TT} — the voltage applied to a resistor termination
3. For the LVCMOS and LVTTL standards: the same V_{OL} and V_{OH} limits apply for the Fast, Slow, and QUIETIO slew attributes.
4. These higher-drive output standards are supported only on FPGA banks 1 and 3. Inputs are unrestricted. See the chapter "Using I/O Resources" in UG331.
5. Tested according to the relevant PCI specifications. For information on PCI IP solutions, see www.xilinx.com/pci. The PCIX IOSTANDARD is available and has equivalent characteristics but no PCI-X IP is supported.

Notes:

1. The numbers in this table are based on the conditions set forth in Table 8 and Table 13.
2. See "External Termination Requirements for Differential I/O," page 20.
3. Output voltage measurements for all differential standards are made with a termination resistor (R_T) of 100Ω across the N and P pins of the differential signal pair.
4. At any given time, no more than two of the following differential output standards can be assigned to an I/O bank: LVDS_25, RSDS_25, MINI_LVDS_25, PPDS_25 when V_{CCO}=2.5V, or LVDS_33, RSDS_33, MINI_LVDS_33, TMDS_33, PPDS_33 when V_{CCO} = 3.3V

Notes:

1. Not all I/O standards are supported on all I/O banks. The left and right banks (I/O banks 1 and 3) support higher output drive current than the top and bottom banks (I/O banks 0 and 2). Similarly, true differential output standards, such as LVDS, RSDS, PPDS, miniLVDS, and TMDS, are only supported in top or bottom banks (I/O banks 0 and 2). Refer to UG331: *Spartan-3 Generation FPGA User Guide* for additional information.
2. The numbers in this table are recommendations that assume sound board lay out practice. Test limits are the V_{IL}/V_{IH} voltage limits for the respective I/O standard.
3. If more than one signal standard is assigned to the I/Os of a given bank, refer to XAPP689: *Managing Ground Bounce in Large FPGAs* for information on how to perform weighted average SSO calculations.

1. The numbers in this table are based on the operating conditions set forth in Table 8 and Table 40.
2. The maximum variable phase shift range, MAX_STEPS, is only valid when the DCM is has no initial fixed phase shifting, that is, the PHASE_SHIFT attribute is set to 0.
3. The DCM_DELAY_STEP values are provided at the bottom of Table 37.

Introduction

This section describes how the various pins on a Spartan®-3A FPGA connect within the supported component packages, and provides device-specific thermal characteristics. For general information on the pin functions and the package characteristics, see the Packaging section of UG331: *Spartan-3 Generation FPGA User Guide*.

- **UG331: Spartan-3 Generation FPGA User Guide**
  www.xilinx.com/support/documentation/user_guides/ug331.pdf

Spartan-3A FPGAs are available in both standard and Pb-free, RoHS versions of each package, with the Pb-free version adding a "G" to the middle of the package code. Except for the thermal characteristics, all information for the standard package applies equally to the Pb-free package.

Pin Types

Most pins on a Spartan-3A FPGA are general-purpose, user-defined I/O pins. There are, however, up to 12 different functional types of pins on Spartan-3A FPGA packages, as outlined in Table 57. In the package footprint drawings that follow, the individual pins are color-coded according to pin type as in the table.

Table 57: **Types of Pins on Spartan-3A FPGAs**

Type / Color Code	Description	Pin Name(s) in Type
I/O	Unrestricted, general-purpose user-I/O pin. Most pins can be paired together to form differential I/Os.	IO_# IO_Lxxy_#
INPUT	Unrestricted, general-purpose input-only pin. This pin does not have an output structure, differential termination resistor, or PCI clamp diode.	IP_# IP_Lxxy_#
DUAL	Dual-purpose pin used in some configuration modes during the configuration process and then usually available as a user I/O after configuration. If the pin is not used during configuration, this pin behaves as an I/O-type pin. See UG332: *Spartan-3 Generation Configuration User Guide* for additional information on these signals.	M[2:0] PUDC_B CCLK MOSI/CSI_B D[7:1] D0/DIN DOUT CSO_B RDWR_B INIT_B A[25:0] VS[2:0] LDC[2:0] HDC
VREF	Dual-purpose pin that is either a user-I/O pin or Input-only pin, or, along with all other VREF pins in the same bank, provides a reference voltage input for certain I/O standards. If used for a reference voltage within a bank, all VREF pins within the bank must be connected.	IP/VREF_# IP_Lxxy_#/VREF_# IO/VREF_# IO_Lxxy_#/VREF_#
CLK	Either a user-I/O pin or an input to a specific clock buffer driver. Most packages have 16 global clock inputs that optionally clock the entire device. The exceptions are the TQ144 and the XC3S50A in the FT256 package). The RHCLK inputs optionally clock the right half of the device. The LHCLK inputs optionally clock the left half of the device. See the Using Global Clock Resources chapter in UG331: *Spartan-3 Generation FPGA User Guide* for additional information on these signals.	IO_Lxxy_#/GCLK[15:0], IO_Lxxy_#/LHCLK[7:0], IO_Lxxy_#/RHCLK[7:0]
CONFIG	Dedicated configuration pin, two per device. Not available as a user-I/O pin. Every package has two dedicated configuration pins. These pins are powered by VCCAUX. See the UG332: *Spartan-3 Generation Configuration User Guide* for additional information on the DONE and PROG_B signals.	DONE, PROG_B

VQ100: 100-lead Very Thin Quad Flat Package

The XC3S50A and XC3S200 are available in the 100-lead very thin quad flat package, VQ100.

Table 63 lists all the package pins. They are sorted by bank number and then by pin name. Pins that form a differential I/O pair appear together in the table. The table also shows the pin number for each pin and the pin type, as defined earlier.

The VQ100 does not support Suspend mode (SUSPEND and AWAKE are not connected), the address output pins for the Byte-wide Peripheral Interface (BPI) configuration mode, or daisy chain configuration (DOUT is not connected).

Table 63 also indicates that some differential I/O pairs have different assignments between the XC3S50A and the XC3S200A, highlighted in light blue. See "Footprint Migration Differences," page 72 for additional information.

An electronic version of this package pinout table and footprint diagram is available for download from the Xilinx website at

www.xilinx.com/support/documentation/data_sheets/s3a_pin.zip.

User I/Os by Bank

Table 70, Table 71, and Table 72 indicate how the available user-I/O pins are distributed between the four I/O banks on the FT256 package. The AWAKE pin is counted as a dual-purpose I/O.

The XC3S50A FPGA in the FT256 package has 51 unconnected balls, labeled with an “N.C.” type. These pins are also indicated in Figure 20.

Footprint Migration Differences

The XC3S400A and XC3S700A FPGAs have identical footprints in the FG400 package. Designs can migrate between the XC3S400A and XC3S700A FPGAs without further consideration.

FG676: 676-ball Fine-pitch Ball Grid Array

The 676-ball fine-pitch ball grid array, FG676, supports the XC3S1400A FPGA.

Table 87 lists all the FG676 package pins. They are sorted by bank number and then by pin name. Pairs of pins that form a differential I/O pair appear together in the table. The table also shows the pin number for each pin and the pin type, as defined earlier.

The XC3S1400A has 17 unconnected balls, indicated as N.C. (No Connection) in Table 87 and with the black diamond character (◆) in Table 87 and Figure 27.

An electronic version of this package pinout table and footprint diagram is available for download from the Xilinx website at:

www.xilinx.com/support/documentation/data_sheets/s3a_pin.zip.
