Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Obsolete
Core Processor	PIC
Core Size	16-Bit
Speed	32MHz
Connectivity	I²C, IrDA, LINbus, SPI, UART/USART
Peripherals	Brown-out Detect/Reset, LVD, POR, PWM, WDT
Number of I/O	24
Program Memory Size	8KB (2.75K x 24)
Program Memory Type	FLASH
EEPROM Size	512 x 8
RAM Size	2K x 8
Voltage - Supply (Vcc/Vdd)	1.8V ~ 3.6V
Data Converters	A/D 19x10b/12b; D/A 2x8b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 85°C (TA)
Mounting Type	Surface Mount
Package / Case	28-SSOP (0.209", 5.30mm Width)
Supplier Device Package	28-SSOP
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/pic24f08km202t-i-ss

TABLE 1-3: DEVICE FEATURES FOR THE PIC24FV16KM204 FAMILY

Features	PIC24FV16KM204	PIC24FV08KM204	PIC24FV16KM202	PIC24FV08KM202
Operating Frequency	DC-32 MHz			
Program Memory (bytes)	16K	8K	16K	8K
Program Memory (instructions)	5632	2816	5632	2816
Data Memory (bytes)	2048			
Data EEPROM Memory (bytes)	512			
Interrupt Sources (soft vectors/NMI traps)	40 (36/4)			
Voltage Range	2.0-5.5V			
I/O Ports	PORTA<11:7,5:0> PORTB<15:0> PORTC<9:0>		PORTA<7,5:0> PORTB<15:0>	
Total I/O Pins	37		23	
Timers	11 (One 16-bit timer, five MCCPs/SCCPs with up to two 16/32 timers each)			
Capture/Compare/PWM modules MCCP SCCP	 3 2			
Serial Communications MSSP UART	 2 2			
Input Change Notification Interrupt	36		22	
12-Bit Analog-to-Digital Module (input channels)	22		19	
Analog Comparators	3			
8-Bit Digital-to-Analog Converters	2			
Operational Amplifiers	2			
Charge Time Measurement Unit (CTMU)	Yes			
Real-Time Clock and Calendar (RTCC)	Yes			
Configurable Logic Cell (CLC)	2			
Resets (and delays)	POR, BOR, RESET Instruction, $\overline{\text{MCLR}}$, WDT, Illegal Opcode, REPEAT Instruction, Hardware Traps, Configuration Word Mismatch (PWRT, OST, PLL Lock)			
Instruction Set	76 Base Instructions, Multiple Addressing Mode Variations			
Packages	44-Pin QFN/TQFP, 48-Pin UQFN		28-Pin SPDIP/SSOP/SOIC/QFN	

4.3.3 READING DATA FROM PROGRAM MEMORY USING PROGRAM SPACE VISIBILITY

The upper 32 Kbytes of Data Space may optionally be mapped into a 16K word page of the program space. This provides transparent access of stored constant data from the Data Space without the need to use special instructions (i.e., TBLRDL/H).

Program space access through the Data Space occurs if the MSb of the Data Space, EA, is '1' and PSV is enabled by setting the PSV bit in the CPU Control (CORCON<2>) register. The location of the program memory space to be mapped into the Data Space is determined by the Program Space Visibility Page Address register (PSVPAG). This 8-bit register defines any one of 256 possible pages of 16K words in program space. In effect, PSVPAG functions as the upper 8 bits of the program memory address, with the 15 bits of the EA functioning as the lower bits.

By incrementing the PC by 2 for each program memory word, the lower 15 bits of Data Space addresses directly map to the lower 15 bits in the corresponding program space addresses.

Data reads from this area add an additional cycle to the instruction being executed, since two program memory fetches are required.

Although each Data Space address, 8000h and higher, maps directly into a corresponding program memory address (see Figure 4-7), only the lower 16 bits of the 24-bit program word are used to contain the data. The upper 8 bits of any program space locations used as data should be programmed with '1111 1111' or '0000 0000' to force a NOP. This prevents possible issues should the area of code ever be accidentally executed.

Note:	PSV access is temporarily disabled during Table Reads/Writes.

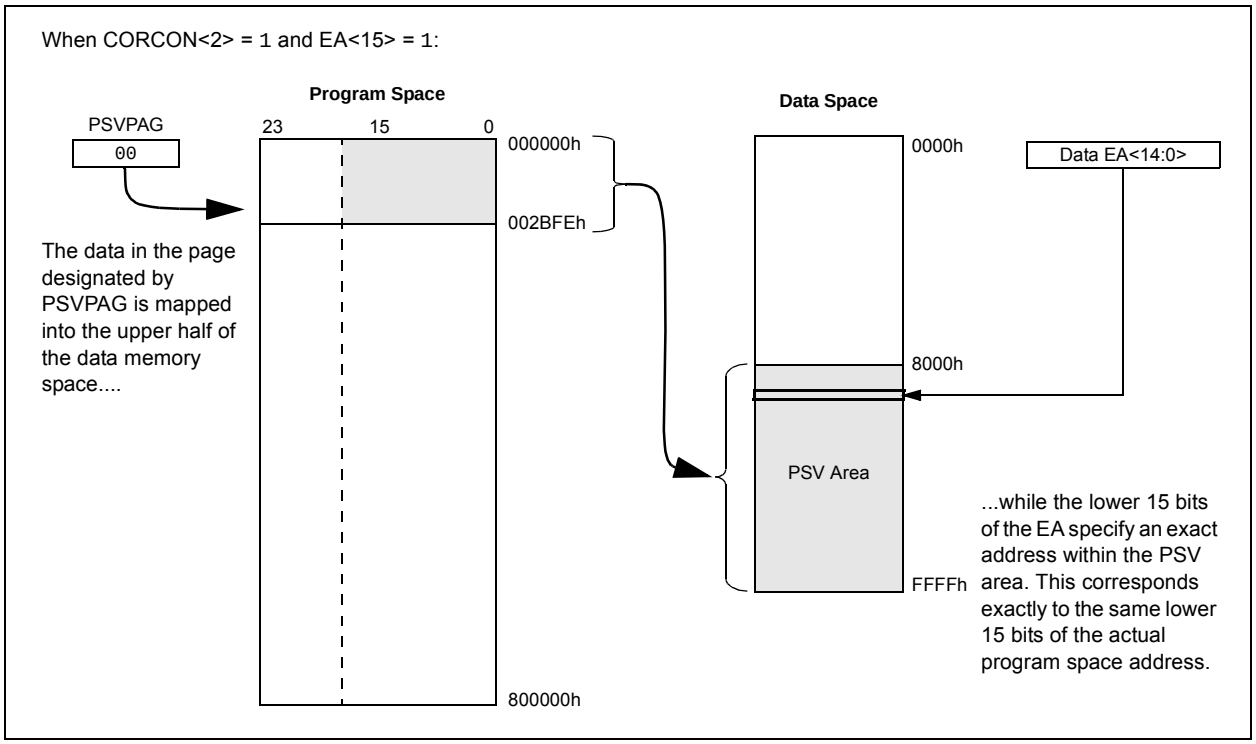
For operations that use PSV and are executed outside a REPEAT loop, the MOV and MOV.D instructions will require one instruction cycle in addition to the specified execution time. All other instructions will require two instruction cycles in addition to the specified execution time.

For operations that use PSV, which are executed inside a REPEAT loop, there will be some instances that require two instruction cycles in addition to the specified execution time of the instruction:

- Execution in the first iteration
- Execution in the last iteration
- Execution prior to exiting the loop due to an interrupt
- Execution upon re-entering the loop after an interrupt is serviced

Any other iteration of the REPEAT loop will allow the instruction accessing data, using PSV, to execute in a single cycle.

FIGURE 4-7: PROGRAM SPACE VISIBILITY OPERATION



EXAMPLE 5-3: LOADING THE WRITE BUFFERS – ASSEMBLY LANGUAGE CODE

```
; Set up NVMCON for row programming operations
        MOV     #0x4004, W0                 ;
        MOV     W0, NVMCON                  ; Initialize NVMCON
; Set up a pointer to the first program memory location to be written
; program memory selected, and writes enabled
        MOV     #0x0000, W0                 ;
        MOV     W0, TBLPAG                  ; Initialize PM Page Boundary SFR
        MOV     #0x1500, W0                 ; An example program memory address
; Perform the TBLWT instructions to write the latches
; 0th_program_word
        MOV     #LOW_WORD_0, W2             ;
        MOV     #HIGH_BYTE_0, W3            ;
        TBLWTL  W2, [W0]                    ; Write PM low word into program latch
        TBLWTH  W3, [W0++]                  ; Write PM high byte into program latch
; 1st_program_word
        MOV     #LOW_WORD_1, W2             ;
        MOV     #HIGH_BYTE_1, W3            ;
        TBLWTL  W2, [W0]                    ; Write PM low word into program latch
        TBLWTH  W3, [W0++]                  ; Write PM high byte into program latch
; 2nd_program_word
        MOV     #LOW_WORD_2, W2             ;
        MOV     #HIGH_BYTE_2, W3            ;
        TBLWTL  W2, [W0]                    ; Write PM low word into program latch
        TBLWTH  W3, [W0++]                  ; Write PM high byte into program latch
        •
        •
        •
; 32nd_program_word
        MOV     #LOW_WORD_31, W2            ;
        MOV     #HIGH_BYTE_31, W3           ;
        TBLWTL  W2, [W0]                    ; Write PM low word into program latch
        TBLWTH  W3, [W0]                    ; Write PM high byte into program latch
```

EXAMPLE 5-4: LOADING THE WRITE BUFFERS – 'C' LANGUAGE CODE

```
// C example using MPLAB C30

   #define NUM_INSTRUCTION_PER_ROW 64
int __attribute__ ((space(auto_psv))) progAddr = 0x1234     // Variable located in Pgm Memory
   unsigned int offset;
   unsigned int i;
   unsigned int progData[2*NUM_INSTRUCTION_PER_ROW];        // Buffer of data to write

   //Set up NVMCON for row programming
   NVMCON = 0x4004;                                         // Initialize NVMCON

   //Set up pointer to the first memory location to be written
   TBLPAG = __builtin_tblpage(&progAddr);                   // Initialize PM Page Boundary SFR
   offset = __builtin_tbloffset(&progAddr);                 // Initialize lower word of address

   //Perform TBLWT instructions to write necessary number of latches
   for(i=0; i < 2*NUM_INSTRUCTION_PER_ROW; i++)
   {
       __builtin_tblwtl(offset, progData[i++]);             // Write to address low word
       __builtin_tblwth(offset, progData[i]);               // Write to upper byte
       offset = offset + 2;                                 // Increment address
   }
```

6.0 DATA EEPROM MEMORY

Note: This data sheet summarizes the features of this group of PIC24F devices. It is not intended to be a comprehensive reference source. For more information on data EEPROM, refer to the *"PIC24F Family Reference Manual"*, **"Data EEPROM"** (DS39720).

The data EEPROM memory is a Nonvolatile Memory (NVM), separate from the program and volatile data RAM. Data EEPROM memory is based on the same Flash technology as program memory, and is optimized for both long retention and a higher number of erase/write cycles.

The data EEPROM is mapped to the top of the user program memory space, with the top address at program memory address, 7FFE00h to 7FFFFFh. The size of the data EEPROM is 256 words in PIC24FXXXXX devices.

The data EEPROM is organized as 16-bit-wide memory. Each word is directly addressable, and is readable and writable during normal operation over the entire VDD range.

Unlike the Flash program memory, normal program execution is not stopped during a data EEPROM program or erase operation.

The data EEPROM programming operations are controlled using the three NVM Control registers:

- NVMCON: Nonvolatile Memory Control Register
- NVMKEY: Nonvolatile Memory Key Register
- NVMADR: Nonvolatile Memory Address Register

6.1 NVMCON Register

The NVMCON register (Register 6-1) is also the primary control register for data EEPROM program/erase operations. The upper byte contains the control bits used to start the program or erase cycle and the flag bit to indicate if the operation was successfully performed. The lower byte of NVMCOM configures the type of NVM operation that will be performed.

6.2 NVMKEY Register

The NVMKEY is a write-only register that is used to prevent accidental writes or erasures of data EEPROM locations.

To start any programming or erase sequence, the following instructions must be executed first, in the exact order provided:

1. Write 55h to NVMKEY.
2. Write AAh to NVMKEY.

After this sequence, a write will be allowed to the NVMCON register for one instruction cycle. In most cases, the user will simply need to set the WR bit in the NVMCON register to start the program or erase cycle. Interrupts should be disabled during the unlock sequence.

The MPLAB® C30 C compiler provides a defined library procedure (`builtin_write_NVM`) to perform the unlock sequence. Example 6-1 illustrates how the unlock sequence can be performed with in-line assembly.

EXAMPLE 6-1: DATA EEPROM UNLOCK SEQUENCE

```
//Disable Interrupts For 5 instructions
asm volatile   ("disi #5");
//Issue Unlock Sequence
asm volatile   ("mov #0x55, W0     \n"
                "mov W0, NVMKEY    \n"
                "mov #0xAA, W1     \n"
                "mov W1, NVMKEY    \n");
// Perform Write/Erase operations
asm volatile   ("bset NVMCON, #WR  \n"
                "nop               \n"
                "nop               \n");
```

6.4.3 READING THE DATA EEPROM

To read a word from data EEPROM, the Table Read instruction is used. Since the EEPROM array is only 16 bits wide, only the TBLRDL instruction is needed. The read operation is performed by loading TBLPAG and WREG with the address of the EEPROM location, followed by a TBLRDL instruction.

A typical read sequence, using the Table Pointer management (builtin_tblpage and builtin_tbloffset) and Table Read (builtin_tblrdl) procedures from the C30 compiler library, is provided in Example 6-5.

Program Space Visibility (PSV) can also be used to read locations in the data EEPROM.

EXAMPLE 6-5: READING THE DATA EEPROM USING THE TBLRD COMMAND

```
int __attribute__ ((space(eedata))) eeData = 0x1234;
int data;                                               // Data read from EEPROM
/*-----------------------------------------------------------------------------------------------
The variable eeData must be a Global variable declared outside of any method

the code following this comment can be written inside the method that will execute the read
-----------------------------------------------------------------------------------------------
*/
    unsigned int offset;

    // Set up a pointer to the EEPROM location to be erased
    TBLPAG = __builtin_tblpage(&eeData);                // Initialize EE Data page pointer
    offset = __builtin_tbloffset(&eeData);              // Initizlize lower word of address
    data = __builtin_tblrdl(offset);                    // Write EEPROM data to write latch
```

7.0 RESETS

Note:	This data sheet summarizes the features of this group of PIC24F devices. It is not intended to be a comprehensive reference source. For more information on Resets, refer to the *"PIC24F Family Reference Manual"*, **"Reset with Programmable Brown-out Reset"** (DS39728).

The Reset module combines all Reset sources and controls the device Master Reset Signal, SYSRST. The following is a list of device Reset sources:

- POR: Power-on Reset
- MCLR: Pin Reset
- SWR: RESET Instruction
- WDTR: Watchdog Timer Reset
- BOR: Brown-out Reset
- LPBOR: Low-Power BOR
- TRAPR: Trap Conflict Reset
- IOPUWR: Illegal Opcode Reset
- UWR: Uninitialized W Register Reset

A simplified block diagram of the Reset module is shown in Figure 7-1.

Any active source of Reset will make the SYSRST signal active. Many registers associated with the CPU and peripherals are forced to a known Reset state. Most registers are unaffected by a Reset; their status is unknown on Power-on Reset (POR) and unchanged by all other Resets.

Note:	Refer to the specific peripheral or **Section 3.0 "CPU"** of this data sheet for register Reset states.

All types of device Reset will set a corresponding status bit in the RCON register to indicate the type of Reset (see Register 7-1). A Power-on Reset will clear all bits except for the BOR and POR bits (RCON<1:0>) which are set. The user may set or clear any bit at any time during code execution. The RCON bits only serve as status bits. Setting a particular Reset status bit in software will not cause a device Reset to occur.

The RCON register also has other bits associated with the Watchdog Timer (WDT) and device power-saving states. The function of these bits is discussed in other sections of this manual.

Note:	The status bits in the RCON register should be cleared after they are read so that the next RCON register value after a device Reset will be meaningful.

TMRPS1	TMRPS0	T32	CCSEL	MOD3	MOD2	MOD1	MOD0
bit 7							bit 0

Legend:	r = Reserved bit		
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 15 **CCPON:** CCPx Module Enable bit
1 = Module is enabled with an operating mode specified by the MOD<3:0> control bits
0 = Module is disabled

bit 14 **Unimplemented:** Read as '0'

bit 13 **CCPSIDL:** CCPx Stop in Idle Mode Bit
1 = Discontinues module operation when device enters Idle mode
0 = Continues module operation in Idle mode

bit 12 **Reserved:** Maintain as '0'

bit 11 **TMRSYNC:** Time Base Clock Synchronization bit
1 = Asynchronous module time base clock is selected and synchronized to the internal system clocks (CLKSEL<2:0> ≠ 000)
0 = Synchronous module time base clock is selected and does not require synchronization (CLKSEL<2:0> = 000)

bit 10-8 **CLKSEL<2:0>:** CCPx Time Base Clock Select bits(1)
111 = External TCLKIA input
110 = External TCLKIB input
101 = CLC1
100 = Reserved
011 = LPRC (31 kHz source)
010 = Secondary Oscillator
001 = Reserved
000 = System clock (TCY)

bit 7-6 **TMRPS<1:0>:** Time Base Prescale Select bits
11 = 1:64 Prescaler
10 = 1:16 Prescaler
01 = 1:4 Prescaler
00 = 1:1 Prescaler

bit 5 **T32:** 32-Bit Time Base Select bit
1 = Uses 32-bit time base for timer, single edge output compare or input capture function
0 = Uses 16-bit time base for timer, single edge output compare or input capture function

bit 4 **CCSEL:** Capture/Compare Mode Select bit
1 = Input Capture peripheral
0 = Output Compare/PWM/Timer peripheral (exact function is selected by the MOD<3:0> bits)

Note 1: Clock options are limited in some operating modes. See Table 13-1 for restrictions.

REGISTER 13-2: CCPxCON1H: CCPx CONTROL 1 HIGH REGISTERS

R/W-0	R/W-0	U-0	U-0	R/W-0	R/W-0	R/W-0	R/W-0

TRIGEN(4)	ONESHOT	ALTSYNC	SYNC4	SYNC3	SYNC2	SYNC1	SYNC0
bit 7							bit 0

Legend:			
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 15 **OPSSRC:** Output Postscaler Source Select bit(1)
- 1 = Output postscaler scales module Trigger output events
- 0 = Output postscaler scales time base interrupt events

bit 14 **RTRGEN:** Retrigger Enable bit(2)
- 1 = Time base can be retriggered when TRIGEN bit = 1
- 0 = Time base may not be retriggered when TRIGEN bit = 1

bit 13-12 **Unimplemented:** Read as '0'

bit 11-8 **OPS3<3:0>:** CCPx Interrupt Output Postscale Select bits(3)
- 1111 = Interrupt every 16th time base period match
- 1110 = Interrupt every 15th time base period match
- ...
- 0100 = Interrupt every 5th time base period match
- 0011 = Interrupt every 4th time base period match or 4th input capture event
- 0010 = Interrupt every 3rd time base period match or 3rd input capture event
- 0001 = Interrupt every 2nd time base period match or 2nd input capture event
- 0000 = Interrupt after each time base period match or input capture event

bit 7 **TRIGEN:** CCPx Trigger Enable bit(4)
- 1 = Trigger operation of time base is enabled
- 0 = Trigger operation of time base is disabled

bit 6 **ONESHOT:** One-Shot Mode Enable bit
- 1 = One-Shot Trigger mode is enabled; Trigger duration is set by OSCNT<2:0>
- 0 = One-Shot Trigger mode IS disabled

bit 5 **ALTSYNC:** CCPx Clock Select bits
- 1 = An alternate signal is used as the module synchronization output signal
- 0 = The module synchronization output signal is the Time Base Reset/rollover event

bit 4-0 **SYNC<4:0>:** CCPx Synchronization Source Select bits

See Table 13-6 for the definition of inputs.

Note 1: This control bit has no function in Input Capture modes.

2: This control bit has no function when TRIGEN = 0.

3: Output postscale settings from 1:5 to 1:16 (0100-1111) will result in a FIFO buffer overflow for Input Capture modes.

4: Clock source options are limited when Trigger operation is enabled; refer to Table 13-1.

bit 8 **URX8:** Data of the Received Character bit (in 9-bit mode)

bit 7-0 **URX<7:0>:** Data of the Received Character bits

16.2 RTCC Module Registers

The RTCC module registers are organized into three categories:

- RTCC Control Registers
- RTCC Value Registers
- Alarm Value Registers

16.2.1 REGISTER MAPPING

To limit the register interface, the RTCC Timer and Alarm Time registers are accessed through corresponding register pointers. The RTCC Value register window (RTCVALH and RTCVALL) uses the RTCPTRx bits (RCFGCAL<9:8>) to select the desired Timer register pair (see Table 16-1).

By writing the RTCVALH byte, the RTCC Pointer value, the RTCPTR<1:0> bits decrement by one until they reach '00'. Once they reach '00', the MINUTES and SECONDS value will be accessible through RTCVALH and RTCVALL until the pointer value is manually changed.

TABLE 16-1: RTCVAL REGISTER MAPPING

RTCPTR<1:0>	RTCC Value Register Window	
	RTCVAL<15:8>	RTCVAL<7:0>
00	MINUTES	SECONDS
01	WEEKDAY	HOURS
10	MONTH	DAY
11	—	YEAR

The Alarm Value register window (ALRMVALH and ALRMVALL) uses the ALRMPTRx bits (ALCFGRPT<9:8>) to select the desired Alarm register pair (see Table 16-2).

By writing the ALRMVALH byte, the ALRMPTR<1:0> bits (Alarm Pointer value) decrement by one until they reach '00'. Once they reach '00', the ALRMMIN and ALRMSEC value will be accessible through ALRMVALH and ALRMVALL, until the pointer value is manually changed.

TABLE 16-2: ALRMVAL REGISTER MAPPING

ALRMPTR <1:0>	Alarm Value Register Window	
	ALRMVALH<15:8>	ALRMVALL<7:0>
00	ALRMMIN	ALRMSEC
01	ALRMWD	ALRMHR
10	ALRMMNTH	ALRMDAY
11	PWCSTAB	PWCSAMP

Considering that the 16-bit core does not distinguish between 8-bit and 16-bit read operations, the user must be aware that when reading either the ALRMVALH or ALRMVALL bytes, the ALRMPTR<1:0> value will be decremented. The same applies to the RTCVALH or RTCVALL bytes with the RTCPTR<1:0> being decremented.

Note: This only applies to read operations and not write operations.

16.2.2 WRITE LOCK

In order to perform a write to any of the RTCC Timer registers, the RTCWREN bit (RCFGCAL<13>) must be set (see Example 16-1 and Example 16-2).

Note: To avoid accidental writes to the timer, it is recommended that the RTCWREN bit (RCFGCAL<13>) is kept clear at any other time. For the RTCWREN bit to be set, there is only one instruction cycle time window allowed between the 55h/AA sequence and the setting of RTCWREN. Therefore, it is recommended that code follow the procedure in Example 16-2.

16.2.3 SELECTING RTCC CLOCK SOURCE

There are four reference source clock options that can be selected for the RTCC using the RTCCLK<1:0> bits (RTCPWC<11:10>): 00 = Secondary Oscillator, 01 = LPRC, 10 = 50 Hz External Clock and 11 = 60 Hz External Clock.

EXAMPLE 16-1: SETTING THE RTCWREN BIT IN ASSEMBLY

```
push    w7              ; Store W7 and W8 values on the stack.
push    w8
disi    #5              ; Disable interrupts until sequence is complete.
mov     #0x55, w7       ; Write 0x55 unlock value to NVMKEY.
mov     w7, NVMKEY
mov     #0xAA, w8       ; Write 0xAA unlock value to NVMKEY.
mov     w8, NVMKEY
bset    RCFGCAL, #13    ; Set the RTCWREN bit.
pop     w8              ; Restore the original W register values from the stack.
pop     w7
```

EXAMPLE 16-2: SETTING THE RTCWREN BIT IN 'C'

```
//This builtin function executes implements the unlock sequence and sets
//the RTCWREN bit.
__builtin_write_RTCWEN();
```

16.2.4 RTCC CONTROL REGISTERS

REGISTER 16-1: RCFGCAL: RTCC CALIBRATION AND CONFIGURATION REGISTER(1)

R/W-0	U-0	R/W-0	R-0, HSC	R-0, HSC	R/W-0	R/W-0	R/W-0
RTCEN(2)	—	RTCWREN	RTCSYNC	HALFSEC(3)	RTCOE	RTCPTR1	RTCPTR0
bit 15							bit 8

R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0	R/W-0
CAL7	CAL6	CAL5	CAL4	CAL3	CAL2	CAL1	CAL0
bit 7							bit 0

Legend:	HSC = Hardware Settable/Clearable bit		
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 15 **RTCEN:** RTCC Enable bit(2)
1 = RTCC module is enabled
0 = RTCC module is disabled

bit 14 **Unimplemented:** Read as '0'

bit 13 **RTCWREN:** RTCC Value Registers Write Enable bit
1 = RTCVALH and RTCVALL registers can be written to by the user
0 = RTCVALH and RTCVALL registers are locked out from being written to by the user

bit 12 **RTCSYNC:** RTCC Value Registers Read Synchronization bit
1 = RTCVALH, RTCVALL and ALCFGRPT registers can change while reading due to a rollover ripple resulting in an invalid data read. If the register is read twice and results in the same data, the data can be assumed to be valid.
0 = RTCVALH, RTCVALL or ALCFGRPT registers can be read without concern over a rollover ripple

bit 11 **HALFSEC:** Half Second Status bit(3)
1 = Second half period of a second
0 = First half period of a second

bit 10 **RTCOE:** RTCC Output Enable bit
1 = RTCC output is enabled
0 = RTCC output is disabled

bit 9-8 **RTCPTR<1:0>:** RTCC Value Register Window Pointer bits
Points to the corresponding RTCC Value registers when reading the RTCVALH and RTCVALL registers. The RTCPTR<1:0> value decrements on every read or write of RTCVALH until it reaches '00'.
RTCVAL<15:8>:
00 = MINUTES
01 = WEEKDAY
10 = MONTH
11 = Reserved
RTCVAL<7:0>:
00 = SECONDS
01 = HOURS
10 = DAY
11 = YEAR

Note 1: The RCFGCAL register is only affected by a POR.
2: A write to the RTCEN bit is only allowed when RTCWREN = 1.
3: This bit is read-only; it is cleared to '0' on a write to the lower half of the MINSEC register.

REGISTER 17-3: CLCxSEL: CLCx INPUT MUX SELECT REGISTER (CONTINUED)

bit 6-4 **DS2<2:0>:** Data Selection MUX 2 Signal Selection bits
111 = MCCP2 Compare Event Flag (CCP2IF)
110 = MCCP1 Compare Event Flag (CCP1IF)
101 = Digital logic low
100 = A/D end of conversion event
For CLC1:
011 = UART1 TX
010 = Comparator 1 output
001 = CLC2 output
000 = CLCINB I/O pin
For CLC2:
011 = UART2 TX
010 = Comparator 1 output
001 = CLC1 output
000 = CLCINB I/O pin

bit 3 **Unimplemented:** Read as '0'

bit 2-0 **DS1<2:0>:** Data Selection MUX 1 Signal Selection bits
111 = SCCP5 Compare Event Flag (CCP5IF)
110 = SCCP4 Compare Event Flag (CCP4IF)
101 = Digital logic low
100 = 8 MHz FRC clock source
011 = LPRC clock source
010 = SOSC clock source
001 = System clock (TCY)
000 = CLCINA I/O pin

REGISTER 19-1: AD1CON1: A/DA/D CONTROL REGISTER 1 (CONTINUED)

bit 3 **Unimplemented:** Read as '0'

bit 2 **ASAM:** A/D Sample Auto-Start bit
1 = Sampling begins immediately after the last conversion; SAMP bit is auto-set
0 = Sampling begins when the SAMP bit is manually set

bit 1 **SAMP:** A/D Sample Enable bit
1 = A/D Sample-and-Hold amplifiers are sampling
0 = A/D Sample-and-Hold amplifiers are holding

bit 0 **DONE:** A/D Conversion Status bit
1 = A/D conversion cycle has completed
0 = A/D conversion cycle has not started or is in progress

Note 1: This version of the TMR1 Trigger allows A/D conversions to be triggered from TMR1 while the device is operating in Sleep mode. The SSRC<3:0> = 0101 option allows conversions to be triggered in Run or Idle modes only.

48-Lead Plastic Ultra Thin Quad Flat, No Lead Package (MV) – 6x6x0.5 mm Body [UQFN]
