

Welcome to [E-XFL.COM](https://www.e-xfl.com)

### What is "[Embedded - Microcontrollers](#)"?

"[Embedded - Microcontrollers](#)" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

### Applications of "[Embedded - Microcontrollers](#)"

#### Details

|                            |   |
|----------------------------|---|
| Product Status             | Obsolete  |
| Core Processor             | PIC   |
| Core Size                  | 16-Bit  |
| Speed                      | 32MHz   |
| Connectivity               | I <sup>2</sup> C, IrDA, LINbus, SPI, UART/USART   |
| Peripherals                | Brown-out Detect/Reset, LVD, POR, PWM, WDT  |
| Number of I/O              | 38  |
| Program Memory Size        | 8KB (2.75K x 24)  |
| Program Memory Type        | FLASH   |
| EEPROM Size                | 512 x 8   |
| RAM Size                   | 2K x 8  |
| Voltage - Supply (Vcc/Vdd) | 1.8V ~ 3.6V   |
| Data Converters            | A/D 22x10b/12b; D/A 2x8b  |
| Oscillator Type            | Internal  |
| Operating Temperature      | -40°C ~ 125°C (TA)  |
| Mounting Type              | Surface Mount   |
| Package / Case             | 44-TQFP   |
| Supplier Device Package    | 44-TQFP (10x10)   |

## 2.0 GUIDELINES FOR GETTING STARTED WITH 16-BIT MICROCONTROLLERS

### 2.1 Basic Connection Requirements

Getting started with the PIC24FV16KM204 family of 16-bit microcontrollers requires attention to a minimal set of device pin connections before proceeding with development.

The following pins must always be connected:

- All VDD and VSS pins (see **Section 2.2 “Power Supply Pins”**)
- All AVDD and AVSS pins, regardless of whether or not the analog device features are used (see **Section 2.2 “Power Supply Pins”**)
- MCLR pin (see **Section 2.3 “Master Clear (MCLR) Pin”**)
- VCAP pins (see **Section 2.4 “Voltage Regulator Pin (VCAP)”**)

These pins must also be connected if they are being used in the end application:

- PGECx/PGEDx pins used for In-Circuit Serial Programming™ (ICSP™) and debugging purposes (see **Section 2.5 “ICSP Pins”**)
- OSCI and OSCO pins when an external oscillator source is used (see **Section 2.6 “External Oscillator Pins”**)

Additionally, the following pins may be required:

- VREF+/VREF- pins are used when external voltage reference for analog modules is implemented

**Note:** The AVDD and AVSS pins must always be connected, regardless of whether any of the analog modules are being used.

The minimum mandatory connections are shown in Figure 2-1.

FIGURE 2-1: RECOMMENDED MINIMUM CONNECTIONS

# PIC24FV16KM204 FAMILY

## 2.4 Voltage Regulator Pin (VCAP)

**Note:** This section applies only to PIC24FV16KM devices with an on-chip voltage regulator.

Some of the PIC24FV16KM devices have an internal voltage regulator. These devices have the voltage regulator output brought out on the VCAP pin. On the PIC24F K devices with regulators, a low-ESR ( $< 5\Omega$ ) capacitor is required on the VCAP pin to stabilize the voltage regulator output. The VCAP pin must not be connected to VDD and must use a capacitor of 10  $\mu\text{F}$  connected to ground. The type can be ceramic or tantalum. Suitable examples of capacitors are shown in Table 2-1. Capacitors with equivalent specifications can be used.

Designers may use Figure 2-3 to evaluate ESR equivalence of candidate devices.

The placement of this capacitor should be close to VCAP. It is recommended that the trace length not exceed 0.25 inch (6 mm). Refer to **Section 27.0 “Electrical Characteristics”** for additional information.

Refer to **Section 27.0 “Electrical Characteristics”** for information on VDD and VDDCORE.

**FIGURE 2-3: FREQUENCY vs. ESR PERFORMANCE FOR SUGGESTED VCAP**

**Note 1:** These registers are available only on PIC24F(V)16KM2XX devices.

## 4.3.2 DATA ACCESS FROM PROGRAM MEMORY AND DATA EEPROM MEMORY USING TABLE INSTRUCTIONS

The **TBLRDL** and **TBLWTL** instructions offer a direct method of reading or writing the lower word of any address within the program memory without going through Data Space. It also offers a direct method of reading or writing a word of any address within data EEPROM memory. The **TBLRDH** and **TBLWTH** instructions are the only method to read or write the upper 8 bits of a program space word as data.

**Note:** The **TBLRDH** and **TBLWTH** instructions are not used while accessing data EEPROM memory.

The PC is incremented by 2 for each successive 24-bit program word. This allows program memory addresses to directly map to Data Space addresses. Program memory can thus be regarded as two 16-bit, word-wide address spaces, residing side by side, each with the same address range. **TBLRDL** and **TBLWTL** access the space which contains the least significant data word, and **TBLRDH** and **TBLWTH** access the space which contains the upper data byte.

Two table instructions are provided to move byte or word-sized (16-bit) data to and from program space. Both function as either byte or word operations.

1. **TBLRDL** (Table Read Low): In Word mode, it maps the lower word of the program space location ( $P<15:0>$ ) to a data address ( $D<15:0>$ ).

In Byte mode, either the upper or lower byte of the lower program word is mapped to the lower byte of a data address. The upper byte is selected when byte select is '1'; the lower byte is selected when it is '0'.

2. **TBLRDH** (Table Read High): In Word mode, it maps the entire upper word of a program address ( $P<23:16>$ ) to a data address. Note that  $D<15:8>$ , the 'phantom' byte, will always be '0'.

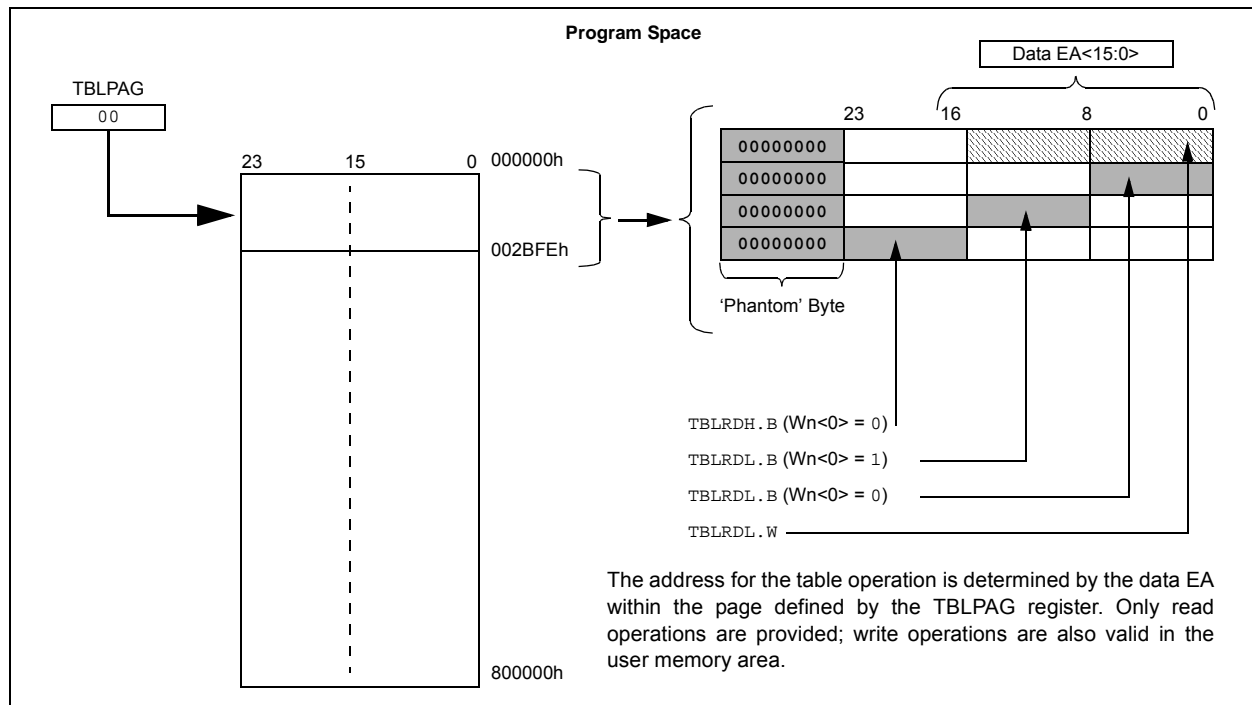

In Byte mode, it maps the upper or lower byte of the program word to  $D<7:0>$  of the data address, as above. Note that the data will always be '0' when the upper 'phantom' byte is selected (Byte Select = 1).

In a similar fashion, two table instructions, **TBLWTH** and **TBLWTL**, are used to write individual bytes or words to a program space address. The details of their operation are explained in **Section 5.0 "Flash Program Memory"**.

For all table operations, the area of program memory space to be accessed is determined by the Table Memory Page Address register (**TBLPAG**). **TBLPAG** covers the entire program memory space of the device, including user and configuration spaces. When  $TBLPAG<7> = 0$ , the table page is located in the user memory space. When  $TBLPAG<7> = 1$ , the page is located in configuration space.

**Note:** Only Table Read operations will execute in the configuration memory space, and only then, in implemented areas, such as the Device ID. Table Write operations are not allowed.

**FIGURE 4-6: ACCESSING PROGRAM MEMORY WITH TABLE INSTRUCTIONS**

# PIC24FV16KM204 FAMILY

---

## 5.2 RTSP Operation

The PIC24F Flash program memory array is organized into rows of 32 instructions or 96 bytes. RTSP allows the user to erase blocks of 1 row, 2 rows and 4 rows (32, 64 and 128 instructions) at a time, and to program one row at a time. It is also possible to program single words.

The 1-row (96 bytes), 2-row (192 bytes) and 4-row (384 bytes) erase blocks, and single row write block (96 bytes) are edge-aligned, from the beginning of program memory.

When data is written to program memory using `TBLWT` instructions, the data is not written directly to memory. Instead, data written using Table Writes is stored in holding latches until the programming sequence is executed.

Any number of `TBLWT` instructions can be executed and a write will be successfully performed. However, 32 `TBLWT` instructions are required to write the full row of memory.

The basic sequence for RTSP programming is to set up a Table Pointer, then do a series of `TBLWT` instructions to load the buffers. Programming is performed by setting the control bits in the `NVMCON` register.

Data can be loaded in any order and the holding registers can be written to multiple times before performing a write operation. Subsequent writes, however, will wipe out any previous writes.

|  |
|--|
| <b>Note:</b> Writing to a location multiple times, without erasing it, is not recommended. |
|--|

All of the Table Write operations are single-word writes (two instruction cycles), because only the buffers are written. A programming cycle is required for programming each row.

## 5.3 Enhanced In-Circuit Serial Programming

Enhanced ICSP uses an on-board bootloader, known as the Program Executive (PE), to manage the programming process. Using an SPI data frame format, the Program Executive can erase, program and verify program memory. For more information on Enhanced ICSP, see the device programming specification.

## 5.4 Control Registers

There are two SFRs used to read and write the program Flash memory: `NVMCON` and `NVMKEY`.

The `NVMCON` register (Register 5-1) controls the blocks that need to be erased, which memory type is to be programmed and when the programming cycle starts.

`NVMKEY` is a write-only register that is used for write protection. To start a programming or erase sequence, the user must consecutively write 55h and AAh to the `NVMKEY` register. Refer to **Section 5.5 “Programming Operations”** for further details.

## 5.5 Programming Operations

A complete programming sequence is necessary for programming or erasing the internal Flash in RTSP mode. During a programming or erase operation, the processor stalls (waits) until the operation is finished. Setting the `WR` bit (`NVMCON<15>`) starts the operation and the `WR` bit is automatically cleared when the operation is finished.

# PIC24FV16KM204 FAMILY

## 13.5 Auxiliary Output

The MCCPx and SCCPx modules have an auxiliary (secondary) output that provides other peripherals access to internal module signals. The auxiliary output is intended to connect to other MCCP or SCCP modules, or other digital peripherals, to provide these types of functions:

- Time Base Synchronization
- Peripheral Trigger and Clock Inputs
- Signal Gating

The type of output signal is selected using the AUXOUT<1:0> control bits (CCPxCON2H<4:3>). The type of output signal is also dependent on the module operating mode.

On the PIC24FV16KM204 family of devices, only the CTMU discharge trigger has access to the auxiliary output signal.

**TABLE 13-5: AUXILIARY OUTPUT**

| AUXOUT<1:0> | CCSEL | MOD<3:0>                | Comments                  | Signal Description                  |

# PIC24FV16KM204 FAMILY

To perform an A/D conversion:

1. Configure the A/D module:
  - a) Configure the port pins as analog inputs and/or select band gap reference inputs (ANSx registers).
  - b) Select the voltage reference source to match the expected range on the analog inputs (AD1CON2<15:13>).
  - c) Select the analog conversion clock to match the desired data rate with the processor clock (AD1CON3<7:0>).
  - d) Select the appropriate sample/conversion sequence (AD1CON1<7:4> and AD1CON3<12:8>).
  - e) Configure the MODE12 bit to select A/D resolution (AD1CON1<10>).
  - f) Select how conversion results are presented in the buffer (AD1CON1<9:8>).
  - g) Select the interrupt rate (AD1CON2<6:2>).
  - h) Turn on the A/D module (AD1CON1<15>).
2. Configure the A/D interrupt (if required):
  - a) Clear the AD1IF bit.
  - b) Select the A/D interrupt priority.

To perform an A/D sample and conversion using Threshold Detect scanning:

1. Configure the A/D module:
  - a) Configure the port pins as analog inputs (ANSx registers).
  - b) Select the voltage reference source to match the expected range on the analog inputs (AD1CON2<15:13>).
  - c) Select the analog conversion clock to match the desired data rate with the processor clock (AD1CON3<7:0>).
  - d) Select the appropriate sample/conversion sequence (AD1CON1<7:4> and AD1CON3<12:8>).
  - e) Configure the MODE12 bit to select A/D resolution (AD1CON1<10>).
  - f) Select how the conversion results are presented in the buffer (AD1CON1<9:8>).
  - g) Select the interrupt rate (AD1CON2<6:2>).

2. Configure the threshold compare channels:
  - a) Enable auto-scan; set the ASEN bit (AD1CON5<15>).
  - b) Select the Compare mode, "Greater Than, Less Than or Windowed"; set the CMx bits (AD1CON5<1:0>).
  - c) Select the threshold compare channels to be scanned (AD1CSSH, AD1CSSL).
  - d) If the CTMU is required as a current source for a threshold compare channel, enable the corresponding CTMU channel (AD1CTMENH, AD1CTMENL).
  - e) Write the threshold values into the corresponding ADC1BUFx registers.
  - f) Turn on the A/D module (AD1CON1<15>).

|   |
|---|
| <p><b>Note:</b> If performing an A/D sample and conversion, using Threshold Detect in Sleep Mode, the RC A/D clock source must be selected before entering into Sleep mode.</p> |
|---|

3. Configure the A/D interrupt (OPTIONAL):
  - a) Clear the AD1IF bit.
  - b) Select the A/D interrupt priority.

W = Writable bit

U = Unimplemented bit, read as '0'

-n = Value at POR

'1' = Bit is set

'0' = Bit is cleared

x = Bit is unknown

bit 15-8 **Unimplemented:** Read as '0'

bit 7 **CVREN:** Comparator Voltage Reference Enable bit

1 = CVREF circuit is powered on

0 = CVREF circuit is powered down

bit 6 **CVROE:** Comparator VREF Output Enable bit

1 = CVREF voltage level is output on the CVREF pin

0 = CVREF voltage level is disconnected from the CVREF pin

bit 5 **CVRSS:** Comparator VREF Source Selection bit

1 = Comparator reference source, CVRSRC = VREF+ – VREF-

0 = Comparator reference source, CVRSRC = AVDD – AVSS

bit 4-0 **CVR<4:0>:** Comparator VREF Value Selection  $0 \leq \text{CVR}<4:0> \leq 31$  bits

When CVRSS = 1:

$\text{CVREF} = (\text{VREF-}) + (\text{CVR}<4:0>/32) \cdot (\text{VREF+} - \text{VREF-})$

When CVRSS = 0:

$\text{CVREF} = (\text{AVSS}) + (\text{CVR}<4:0>/32) \cdot (\text{AVDD} - \text{AVSS})$

R = Readable bit

P = Programmable bit

U = Unimplemented bit, read as '0'

-n = Value at POR

'1' = Bit is set

'0' = Bit is cleared

x = Bit is unknown

bit 7 **MCLRE:** MCLR Pin Enable bit<sup>(2)</sup>

1 = MCLR pin is enabled; RA5 input pin is disabled

0 = RA5 input pin is enabled; MCLR is disabled

bit 6-5 **BORV<1:0>:** Brown-out Reset Enable bits<sup>(3)</sup>

11 = Brown-out Reset is set to the lowest voltage

10 = Brown-out Reset is set to the middle voltage

01 = Brown-out Reset is set to the highest voltage

00 = Downside protection on POR is enabled – Low-Power BOR (LPBOR) is selected

bit 4 **I2C1SEL:** Alternate I2C1 Pin Mapping bit<sup>(1)</sup>

1 = Default location for SCL1/SDA1 pins

0 = Alternate location for SCL1/SDA1 pins

bit 3 **PWRTEN:** Power-up Timer Enable bit

1 = PWRT is enabled

0 = PWRT is disabled

bit 2 **RETCFG:** Retention Regulator Configuration bit<sup>(1)</sup>

1 = Low-voltage regulator is not available

0 = Low-voltage regulator is available and controlled by the RETEN bit (RCON<12>) during Sleep

bit 1-0 **BOREN<1:0>:** Brown-out Reset Enable bits

11 = Brown-out Reset is enabled in hardware; SBOREN bit is disabled

10 = Brown-out Reset is enabled only while device is active and disabled in Sleep; SBOREN bit is disabled

01 = Brown-out Reset is controlled with the SBOREN bit setting

00 = Brown-out Reset is disabled in hardware; SBOREN bit is disabled

**Note 1:** This setting only applies to the “FV” devices. This bit is reserved and should be maintained as ‘1’ on “F” devices.

**2:** The MCLRE fuse can only be changed when using the VPP-based ICSP™ mode entry. This prevents a user from accidentally locking out the device from the low-voltage test entry.

**3:** Refer to **Section 27.0 “Electrical Characteristics”** for BOR voltages.
