
Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Obsolete
Core Processor	PIC
Core Size	16-Bit
Speed	32MHz
Connectivity	I²C, IrDA, LINbus, SPI, UART/USART
Peripherals	Brown-out Detect/Reset, LVD, POR, PWM, WDT
Number of I/O	38
Program Memory Size	8KB (2.75K x 24)
Program Memory Type	FLASH
EEPROM Size	512 x 8
RAM Size	2K x 8
Voltage - Supply (Vcc/Vdd)	1.8V ~ 3.6V
Data Converters	A/D 22x10b/12b; D/A 2x8b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 85°C (TA)
Mounting Type	Surface Mount
Package / Case	44-VQFN Exposed Pad
Supplier Device Package	44-QFN (8x8)
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/pic24f08km204-i-ml

TABLE 1-3: DEVICE FEATURES FOR THE PIC24FV16KM204 FAMILY

Features	PIC24FV16KM204	PIC24FV08KM204	PIC24FV16KM202	PIC24FV08KM202
Operating Frequency	DC-32 MHz			
Program Memory (bytes)	16K	8K	16K	8K
Program Memory (instructions)	5632	2816	5632	2816
Data Memory (bytes)	2048			
Data EEPROM Memory (bytes)	512			
Interrupt Sources (soft vectors/NMI traps)	40 (36/4)			
Voltage Range	2.0-5.5V			
I/O Ports	PORTA<11:7,5:0> PORTB<15:0> PORTC<9:0>		PORTA<7,5:0> PORTB<15:0>	
Total I/O Pins	37		23	
Timers	11 (One 16-bit timer, five MCCPs/SCCPs with up to two 16/32 timers each)			
Capture/Compare/PWM modules MCCP SCCP	 3 2			
Serial Communications MSSP UART	 2 2			
Input Change Notification Interrupt	36		22	
12-Bit Analog-to-Digital Module (input channels)	22		19	
Analog Comparators	3			
8-Bit Digital-to-Analog Converters	2			
Operational Amplifiers	2			
Charge Time Measurement Unit (CTMU)	Yes			
Real-Time Clock and Calendar (RTCC)	Yes			
Configurable Logic Cell (CLC)	2			
Resets (and delays)	POR, BOR, RESET Instruction, $\overline{\text{MCLR}}$, WDT, Illegal Opcode, REPEAT Instruction, Hardware Traps, Configuration Word Mismatch (PWRT, OST, PLL Lock)			
Instruction Set	76 Base Instructions, Multiple Addressing Mode Variations			
Packages	44-Pin QFN/TQFP, 48-Pin UQFN		28-Pin SPDIP/SSOP/SOIC/QFN	

TABLE 1-5: PIC24FV16KM204 FAMILY PINOUT DESCRIPTION (CONTINUED)

Function	F					FV					I/O	Buffer	Description
	Pin Number					Pin Number							
	20-Pin PDIP/ SSOP/ SOIC	28-Pin PDIP/ SSOP/ SOIC	28-Pin QFN	44-Pin QFN/ TQFP	48-Pin UQFN	20-Pin PDIP/ SSOP/ SOIC	28-Pin PDIP/ SSOP/ SOIC	28-Pin QFN	44-Pin QFN/ TQFP	48-Pin UQFN

Legend: x = unknown, u = unchanged, — = unimplemented, q = value depends on condition, r = reserved.
Note 1: Values are reset only on a VDD POR event.

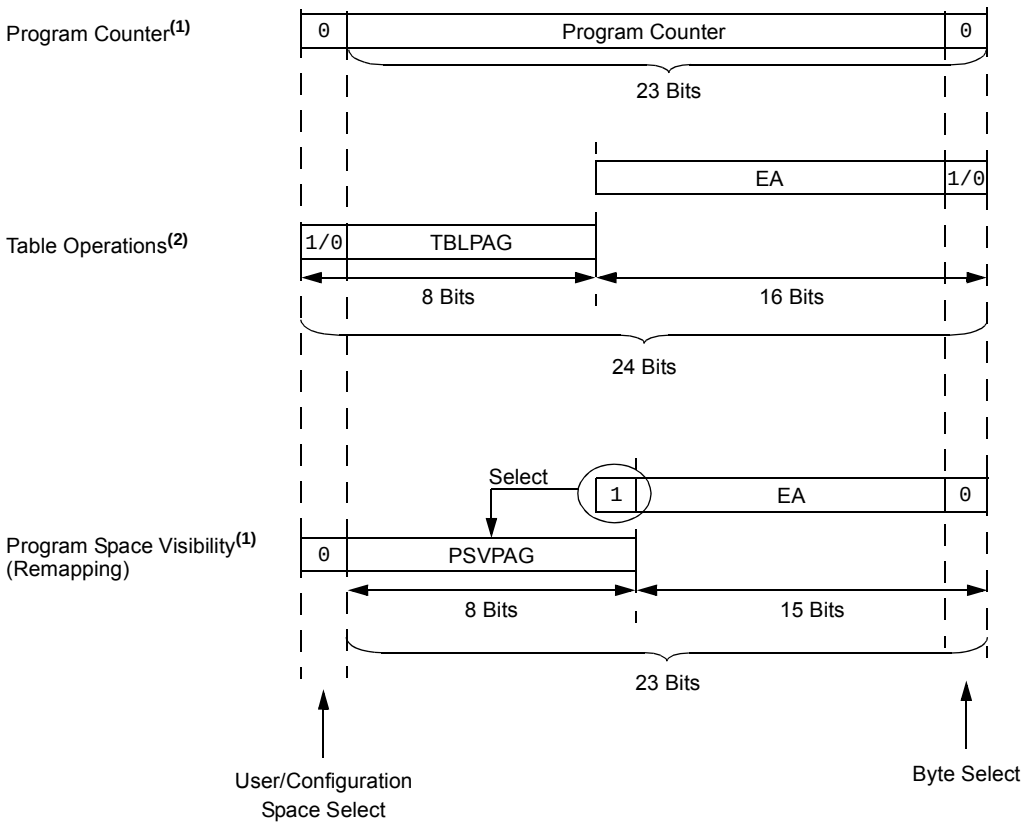
TABLE 4-35: PROGRAM SPACE ADDRESS CONSTRUCTION

Access Type	Access Space	Program Space Address				
		<23>	<22:16>	<15>	<14:1>	<0>
Instruction Access (Code Execution)	User	0	PC<22:1>			0
		0xx xxxx xxxx xxxx xxxx xxx0				
TBLRD/TBLWT (Byte/Word Read/Write)	User	TBLPAG<7:0>		Data EA<15:0>		
		0xxx xxxx		xxxx xxxx xxxx xxxx		
	Configuration	TBLPAG<7:0>		Data EA<15:0>		
		1xxx xxxx		xxxx xxxx xxxx xxxx		
Program Space Visibility (Block Remap/Read)	User	0	PSVPAG<7:0>(2)		Data EA<14:0>(1)	
		0	xxxx xxxx		xxx xxxx xxxx xxxx	

Note 1: Data EA<15> is always '1' in this case, but is not used in calculating the program space address. Bit 15 of the address is PSVPAG<0>.

2: PSVPAG can have only two values ('00' to access program memory and FF to access data EEPROM) on the PIC24F16KM family.

FIGURE 4-5: DATA ACCESS FROM PROGRAM SPACE ADDRESS GENERATION



Note 1: The LSb of program space addresses is always fixed as '0' in order to maintain word alignment of data in the program and Data Spaces.

2: Table operations are not required to be word-aligned. Table Read operations are permitted in the configuration memory space.

7.1 Clock Source Selection at Reset

If clock switching is enabled, the system clock source at device Reset is chosen, as shown in Table 7-2. If clock switching is disabled, the system clock source is always selected according to the Oscillator Configuration bits. For more information, see **Section 9.0 "Oscillator Configuration"**.

TABLE 7-2: OSCILLATOR SELECTION vs. TYPE OF RESET (CLOCK SWITCHING ENABLED)

Reset Type	Clock Source Determinant
POR	FNOSC<2:0> Configuration bits (FOSCSEL<2:0>)
BOR	
$\overline{\text{MCLR}}$	COSC<2:0> Control bits (OSCCON<14:12>)
WDTO	
SWR	

7.2 Device Reset Times

The Reset times for various types of device Reset are summarized in Table 7-3. Note that the system Reset signal, $\overline{\text{SYSRST}}$, is released after the POR and PWRT delay times expire.

The time at which the device actually begins to execute code will also depend on the system oscillator delays, which include the Oscillator Start-up Timer (OST) and the PLL lock time. The OST and PLL lock times occur in parallel with the applicable $\overline{\text{SYSRST}}$ delay times.

The FSCM delay determines the time at which the FSCM begins to monitor the system clock source after the $\overline{\text{SYSRST}}$ signal is released.

TABLE 7-3: RESET DELAY TIMES FOR VARIOUS DEVICE RESETS

Reset Type	Clock Source	$\overline{\text{SYSRST}}$ Delay	System Clock Delay	Notes
POR(6)	EC	TPOR + TPWRT	—	1, 2
	FRC, FRCDIV	TPOR + TPWRT	TFRC	1, 2, 3
	LPRC	TPOR + TPWRT	TLPRC	1, 2, 3
	ECPLL	TPOR + TPWRT	TLOCK	1, 2, 4
	FRCPLL	TPOR + TPWRT	TFRC + TLOCK	1, 2, 3, 4
	XT, HS, SOSC	TPOR+ TPWRT	TOST	1, 2, 5
	XTPLL, HSPLL	TPOR + TPWRT	TOST + TLOCK	1, 2, 4, 5
BOR	EC	TPWRT	—	2
	FRC, FRCDIV	TPWRT	TFRC	2, 3
	LPRC	TPWRT	TLPRC	2, 3
	ECPLL	TPWRT	TLOCK	2, 4
	FRCPLL	TPWRT	TFRC + TLOCK	2, 3, 4
	XT, HS, SOSC	TPWRT	TOST	2, 5
	XTPLL, HSPLL	TPWRT	TFRC + TLOCK	2, 3, 4
All Others	Any Clock	—	—	None

Note 1: TPOR = Power-on Reset delay.

2: TPWRT = 64 ms nominal if the Power-up Timer is enabled; otherwise, it is zero.

3: TFRC and TLPRC = RC Oscillator start-up times.

4: TLOCK = PLL Lock time.

5: TOST = Oscillator Start-up Timer (OST). A 10-bit counter waits 1024 oscillator periods before releasing the oscillator clock to the system.

6: If Two-Speed Start-up is enabled, regardless of the Primary Oscillator selected, the device starts with FRC, and in such cases, FRC start-up time is valid.

Note: For detailed operating frequency and timing specifications, see **Section 27.0 "Electrical Characteristics"**.

NOTES:

13.5 Auxiliary Output

The MCCPx and SCCPx modules have an auxiliary (secondary) output that provides other peripherals access to internal module signals. The auxiliary output is intended to connect to other MCCP or SCCP modules, or other digital peripherals, to provide these types of functions:

- Time Base Synchronization
- Peripheral Trigger and Clock Inputs
- Signal Gating

The type of output signal is selected using the AUXOUT<1:0> control bits (CCPxCON2H<4:3>). The type of output signal is also dependent on the module operating mode.

On the PIC24FV16KM204 family of devices, only the CTMU discharge trigger has access to the auxiliary output signal.

TABLE 13-5: AUXILIARY OUTPUT

AUXOUT<1:0>	CCSEL	MOD<3:0>	Comments	Signal Description
00	x	xxxx	Auxiliary output disabled	No Output
01	0	0000	Time Base modes	Time Base Period Reset or Rollover
10				Special Event Trigger Output
11				No Output
01	0	0001 through 1111	Output Compare modes	Time Base Period Reset or Rollover
10				Output Compare Event Signal
11				Output Compare Signal
01	1	xxxx	Input Capture modes	Time Base Period Reset or Rollover
10				Reflects the Value of the ICDIS bit
11				Input Capture Event Signal

REGISTER 14-2: SSPxSTAT: MSSPx STATUS REGISTER (I^2C™ MODE)

U-0	U-0	U-0	U-0	U-0	U-0	U-0	U-0

bit 15							bit 8

R/W-0	R/W-0	R-0	R-0	R-0	R-0	R-0	R-0
SMP	CKE	D/$\overline{A}$	P(1)	S(1)	R/$\overline{W}$	UA	BF
bit 7							bit 0

Legend:			
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 15-8 **Unimplemented:** Read as '0'

bit 7 **SMP:** Slew Rate Control bit
In Master or Slave mode:
1 = Slew rate control is disabled for Standard Speed mode (100 kHz and 1 MHz)
0 = Slew rate control is enabled for High-Speed mode (400 kHz)

bit 6 **CKE:** SMBus Select bit
In Master or Slave mode:
1 = Enables SMBus-specific inputs
0 = Disables SMBus-specific inputs

bit 5 **D/$\overline{A}$:** Data/$\overline{Address}$ bit
In Master mode:
Reserved.
In Slave mode:
1 = Indicates that the last byte received or transmitted was data
0 = Indicates that the last byte received or transmitted was address

bit 4 **P:** Stop bit(1)
1 = Indicates that a Stop bit has been detected last
0 = Stop bit was not detected last

bit 3 **S:** Start bit(1)
1 = Indicates that a Start bit has been detected last
0 = Start bit was not detected last

bit 2 **R/$\overline{W}$:** Read/$\overline{Write}$ Information bit
In Slave mode:(2)
1 = Read
0 = Write
In Master mode:(3)
1 = Transmit is in progress
0 = Transmit is not in progress

bit 1 **UA:** Update Address bit (10-Bit Slave mode only)
1 = Indicates that the user needs to update the address in the SSPxADD register
0 = Address does not need to be updated

Note 1: This bit is cleared on Reset and when SSPEN is cleared.

2: This bit holds the R/$\overline{W}$ bit information following the last address match. This bit is only valid from the address match to the next Start bit, Stop bit or not $\overline{ACK}$ bit.

3: ORing this bit with SEN, RSEN, PEN, RCEN or ACKEN will indicate if the MSSPx is in Active mode.

REGISTER 14-7: SSPxCON3: MSSPx CONTROL REGISTER 3 (I^2C™ MODE)

Legend:			
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 15-8 **Unimplemented:** Read as '0'

bit 7 **ACKTIM:** Acknowledge Time Status bit(1)
1 = Indicates the I^2C bus is in an Acknowledge sequence, set on the 8th falling edge of the SCLx clock
0 = Not an Acknowledge sequence, cleared on the 9th rising edge of the SCLx clock

bit 6 **PCIE**: Stop Condition Interrupt Enable bit
1 = Enables interrupt on detection of a Stop condition
0 = Stop detection interrupts are disabled(2)

bit 5 **SCIE**: Start Condition Interrupt Enable bit
1 = Enables interrupt on detection of a Start or Restart condition
0 = Start detection interrupts are disabled(2)

bit 4 **BOEN:** Buffer Overwrite Enable bit
I^2C Master mode:
This bit is ignored.
I^2C Slave mode:
1 = SSPxBUF is updated and an $\overline{ACK}$ is generated for a received address/data byte, ignoring the state of the SSPOV bit only if the BF bit = 0
0 = SSPxBUF is only updated when SSPOV is clear

bit 3 **SDAHT:** SDAx Hold Time Selection bit
1 = Minimum of 300 ns hold time on SDAx after the falling edge of SCLx
0 = Minimum of 100 ns hold time on SDAx after the falling edge of SCLx

bit 2 **SBCDE:** Slave Mode Bus Collision Detect Enable bit (Slave mode only)
1 = Enables slave bus collision interrupts
0 = Slave bus collision interrupts are disabled

bit 1 **AHEN:** Address Hold Enable bit (Slave mode only)
1 = Following the 8th falling edge of SCLx for a matching received address byte; CKP bit of the SSPxCON1 register will be cleared and SCLx will be held low
0 = Address holding is disabled

bit 0 **DHEN:** Data Hold Enable bit (Slave mode only)
1 = Following the 8th falling edge of SCLx for a received data byte; slave hardware clears the CKP bit of the SSPxCON1 register and SCLx is held low
0 = Data holding is disabled

Note 1: This bit has no effect in Slave modes for which Start and Stop condition detection is explicitly listed as enabled.
2: The ACKTIM status bit is active only when the AHEN bit or DHEN bit is set.

0 = The Data Source 3 inverted signal is disabled for Gate 3

19.1 A/D Control Registers

The 12-bit A/D Converter module uses up to 43 registers for its operation. All registers are mapped in the data memory space.

19.1.1 CONTROL REGISTERS

Depending on the specific device, the module has up to eleven control and status registers:

- AD1CON1: A/D Control Register 1
- AD1CON2: A/D Control Register 2
- AD1CON3: A/D Control Register 3
- AD1CON5: A/D Control Register 5
- AD1CHS: A/D Sample Select Register
- AD1CHITH and AD1CHITL: A/D Scan Compare Hit Registers
- AD1CSSH and AD1CSSL: A/D Input Scan Select Registers
- AD1CTMENH and AD1CTMENL: CTMU Enable Registers

The AD1CON1, AD1CON2 and AD1CON3 registers (Register 19-1, Register 19-2 and Register 19-3) control the overall operation of the A/D module. This includes enabling the module, configuring the conversion clock and voltage reference sources, selecting the sampling and conversion Triggers, and manually controlling the sample/convert sequences. The AD1CON5 register (Register 19-4) specifically controls features of the Threshold Detect operation, including its function in power-saving modes.

The AD1CHS register (Register 19-5) selects the input channels to be connected to the S/H amplifier. It also allows the choice of input multiplexers and the selection of a reference source for differential sampling.

The AD1CHITH and AD1CHITL registers (Register 19-6 and Register 19-7) are semaphore registers used with Threshold Detect operations. The status of individual bits, or bit pairs in some cases, indicates if a match condition has occurred. AD1CHITL is always implemented, whereas AD1CHITH may not be implemented in devices with 16 or fewer channels.

The AD1CSSH/L registers (Register 19-8 and Register 19-9) select the channels to be included for sequential scanning.

The AD1CTMENH/L registers (Register 19-10 and Register 19-11) select the channel(s) to be used by the CTMU during conversions. Selecting a particular channel allows the A/D Converter to control the CTMU (particularly, its current source) and read its data through that channel. AD1CTMENL is always implemented, whereas AD1CTMENH may not be implemented in devices with 16 or fewer channels.

19.1.2 A/D RESULT BUFFERS

The module incorporates a multi-word, dual port buffer, called ADC1BUFx. Each of the locations is mapped into the data memory space and is separately addressable. The buffer locations are referred to as ADC1BUF0 through ADC1BUFx (x = up to 17).

The A/D result buffers are both readable and writable. When the module is active (AD1CON<15> = 1), the buffers are read-only and store the results of A/D conversions. When the module is inactive (AD1CON<15> = 0), the buffers are both readable and writable. In this state, writing to a buffer location programs a conversion threshold for Threshold Detect operations.

Buffer contents are not cleared when the module is deactivated with the ADON bit (AD1CON1<15>). Conversion results and any programmed threshold values are maintained when ADON is set or cleared.

TABLE 19-4: NUMERICAL EQUIVALENTS OF VARIOUS RESULT CODES: 10-BIT FRACTIONAL FORMATS

VIN/VREF	10-Bit Differential Output Code (11-bit result)	16-Bit Fractional Format/ Equivalent Decimal Value		16-Bit Signed Fractional Format/ Equivalent Decimal Value

bit 15 **CMIDL:** Comparator x Stop in Idle Mode bit
1 = Comparator interrupts are disabled in Idle mode; enabled comparators remain operational
0 = Continues operation of all enabled comparators in Idle mode

bit 14-11 **Unimplemented:** Read as '0'

bit 10 **C3EVT:** Comparator 3 Event Status bit (read-only)(1)
Shows the current event status of Comparator 3 (CM3CON<9>).

bit 9 **C2EVT:** Comparator 2 Event Status bit (read-only)(1)
Shows the current event status of Comparator 2 (CM2CON<9>).

bit 8 **C1EVT:** Comparator 1 Event Status bit (read-only)
Shows the current event status of Comparator 1 (CM1CON<9>).

bit 7-3 **Unimplemented:** Read as '0'

bit 2 **C3OUT:** Comparator 3 Output Status bit (read-only)(1)
Shows the current output of Comparator 3 (CM3CON<8>).

bit 1 **C2OUT:** Comparator 2 Output Status bit (read-only)(1)
Shows the current output of Comparator 2 (CM2CON<8>).

bit 0 **C1OUT:** Comparator 1 Output Status bit (read-only)
Shows the current output of Comparator 1 (CM1CON<8>).

Note 1: Comparator 2 and Comparator 3 are only available on PIC24F(V)16KM2XX devices.

26.2 MPLAB XC Compilers

The MPLAB XC Compilers are complete ANSI C compilers for all of Microchip's 8, 16 and 32-bit MCU and DSC devices. These compilers provide powerful integration capabilities, superior code optimization and ease of use. MPLAB XC Compilers run on Windows, Linux or MAC OS X.

For easy source level debugging, the compilers provide debug information that is optimized to the MPLAB X IDE.

The free MPLAB XC Compiler editions support all devices and commands, with no time or memory restrictions, and offer sufficient code optimization for most applications.

MPLAB XC Compilers include an assembler, linker and utilities. The assembler generates relocatable object files that can then be archived or linked with other relocatable object files and archives to create an executable file. MPLAB XC Compiler uses the assembler to produce its object file. Notable features of the assembler include:

- Support for the entire device instruction set
- Support for fixed-point and floating-point data
- Command-line interface
- Rich directive set
- Flexible macro language
- MPLAB X IDE compatibility

26.3 MPASM Assembler

The MPASM Assembler is a full-featured, universal macro assembler for PIC10/12/16/18 MCUs.

The MPASM Assembler generates relocatable object files for the MPLINK Object Linker, Intel® standard HEX files, MAP files to detail memory usage and symbol reference, absolute LST files that contain source lines and generated machine code, and COFF files for debugging.

The MPASM Assembler features include:

- Integration into MPLAB X IDE projects
- User-defined macros to streamline assembly code
- Conditional assembly for multipurpose source files
- Directives that allow complete control over the assembly process

26.4 MPLINK Object Linker/ MPLIB Object Librarian

The MPLINK Object Linker combines relocatable objects created by the MPASM Assembler. It can link relocatable objects from precompiled libraries, using directives from a linker script.

The MPLIB Object Librarian manages the creation and modification of library files of precompiled code. When a routine from a library is called from a source file, only the modules that contain that routine will be linked in with the application. This allows large libraries to be used efficiently in many different applications.

The object linker/library features include:

- Efficient linking of single libraries instead of many smaller files
- Enhanced code maintainability by grouping related modules together
- Flexible creation of libraries with easy module listing, replacement, deletion and extraction

26.5 MPLAB Assembler, Linker and Librarian for Various Device Families

MPLAB Assembler produces relocatable machine code from symbolic assembly language for PIC24, PIC32 and dsPIC DSC devices. MPLAB XC Compiler uses the assembler to produce its object file. The assembler generates relocatable object files that can then be archived or linked with other relocatable object files and archives to create an executable file. Notable features of the assembler include:

- Support for the entire device instruction set
- Support for fixed-point and floating-point data
- Command-line interface
- Rich directive set
- Flexible macro language
- MPLAB X IDE compatibility
