
Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Active
Core Processor	PIC
Core Size	16-Bit
Speed	32MHz
Connectivity	I²C, IrDA, LINbus, SPI, UART/USART
Peripherals	Brown-out Detect/Reset, LVD, POR, PWM, WDT
Number of I/O	37
Program Memory Size	16KB (5.5K x 24)
Program Memory Type	FLASH
EEPROM Size	512 x 8
RAM Size	1K x 8
Voltage - Supply (Vcc/Vdd)	2V ~ 5V
Data Converters	A/D 22x10b/12b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 85°C (TA)
Mounting Type	Surface Mount
Package / Case	44-VQFN Exposed Pad
Supplier Device Package	44-QFN (8x8)
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/pic24fv16km104-i-ml

000 = Interrupt source is disabled

8.4 Interrupt Setup Procedures

8.4.1 INITIALIZATION

To configure an interrupt source:

1. Set the NSTDIS control bit (INTCON1<15>) if nested interrupts are not desired.
2. Select the user-assigned priority level for the interrupt source by writing the control bits in the appropriate IPCx register. The priority level will depend on the specific application and type of interrupt source. If multiple priority levels are not desired, the IPCx register control bits for all enabled interrupt sources may be programmed to the same non-zero value.

Note:	At a device Reset, the IPCx registers are initialized, such that all user interrupt sources are assigned to Priority Level 4.

3. Clear the interrupt flag status bit associated with the peripheral in the associated IFSx register.
4. Enable the interrupt source by setting the interrupt enable control bit associated with the source in the appropriate IECx register.

8.4.2 INTERRUPT SERVICE ROUTINE

The method that is used to declare an ISR (Interrupt Service Routine) and initialize the IVT with the correct vector address depends on the programming language (i.e., C or assembly), and the language development toolsuite that is used to develop the application. In general, the user must clear the interrupt flag in the appropriate IFSx register for the source of the interrupt that the ISR handles. Otherwise, the ISR will be re-entered immediately after exiting the routine. If the ISR is coded in assembly language, it must be terminated using a `RETFIE` instruction to unstack the saved PC value, SRL value and old CPU priority level.

8.4.3 TRAP SERVICE ROUTINE (TSR)

A Trap Service Routine (TSR) is coded like an ISR, except that the appropriate trap status flag in the INTCON1 register must be cleared to avoid re-entry into the TSR.

8.4.4 INTERRUPT DISABLE

All user interrupts can be disabled using the following procedure:

1. Push the current SR value onto the software stack using the `PUSH` instruction.
2. Force the CPU to Priority Level 7 by inclusive ORing the value, 0Eh, with SRL.

To enable user interrupts, the `POP` instruction may be used to restore the previous SR value.

Only user interrupts with a priority level of 7 or less can be disabled. Trap sources (Levels 8-15) cannot be disabled.

The `DISI` instruction provides a convenient way to disable interrupts of Priority Levels 1-6 for a fixed period. Level 7 interrupt sources are not disabled by the `DISI` instruction.

The following code sequence for a clock switch is recommended:

1. Disable interrupts during the OSCCON register unlock and write sequence.
2. Execute the unlock sequence for the OSCCON high byte by writing 78h and 9Ah to OSCCON<15:8>, in two back-to-back instructions.
3. Write the new oscillator source to the NOSCx bits in the instruction immediately following the unlock sequence.
4. Execute the unlock sequence for the OSCCON low byte by writing 46h and 57h to OSCCON<7:0>, in two back-to-back instructions.
5. Set the OSWEN bit in the instruction immediately following the unlock sequence.
6. Continue to execute code that is not clock-sensitive (optional).
7. Invoke an appropriate amount of software delay (cycle counting) to allow the selected oscillator and/or PLL to start and stabilize.
8. Check to see if OSWEN is '0'. If it is, the switch was successful. If OSWEN is still set, then check the LOCK bit to determine the cause of failure.

The core sequence for unlocking the OSCCON register and initiating a clock switch is shown in Example 9-1 and Example 9-2.

EXAMPLE 9-1: ASSEMBLY CODE SEQUENCE FOR CLOCK SWITCHING

```
;Place the new oscillator selection in W0
;OSCCONH (high byte) Unlock Sequence
MOV         #OSCCONH, w1
MOV         #0x78, w2
MOV         #0x9A, w3
MOV.b       w2, [w1]
MOV.b       w3, [w1]
;Set new oscillator selection
MOV.b       WREG, OSCCONH
;OSCCONL (low byte) unlock sequence
MOV         #OSCCONL, w1
MOV         #0x46, w2
MOV         #0x57, w3
MOV.b       w2, [w1]
MOV.b       w3, [w1]
;Start oscillator switch operation
BSET        OSCCON,#0
```

EXAMPLE 9-2: BASIC 'C' CODE SEQUENCE FOR CLOCK SWITCHING

```
//Use compiler built-in function to write
new clock setting
__builtin_write_OSCCONH(0x01); //0x01
switches to FRCPLL

//Use compiler built-in function to set the
OSWEN bit.
__builtin_write_OSCCONL(OSCCONL | 0x01);

//Optional: Wait for clock switch sequence
to complete
while(OSCCONbits.OSWEN == 1);
```

9.5 Reference Clock Output

In addition to the CLKO output (FOSC/2) available in certain oscillator modes, the device clock in the PIC24FXXXXX family devices can also be configured to provide a reference clock output signal to a port pin. This feature is available in all oscillator configurations and allows the user to select a greater range of clock submultiples to drive external devices in the application.

This reference clock output is controlled by the REFOCON register (Register 9-4). Setting the ROEN bit (REFOCON<15>) makes the clock signal available on the REFO pin. The RODIV<3:0> bits (REFOCON<11:8>) enable the selection of 16 different clock divider options.

The ROSSLP and ROSEL bits (REFOCON<13:12>) control the availability of the reference output during Sleep mode. The ROSEL bit determines if the oscillator on OSC1 and OSC2, or the current system clock source, is used for the reference clock output. The ROSSLP bit determines if the reference source is available on REFO when the device is in Sleep mode.

To use the reference clock output in Sleep mode, both the ROSSLP and ROSEL bits must be set. The device clock must also be configured for one of the primary modes (EC, HS or XT); otherwise, if the ROSEL bit is not also set, the oscillator on OSC1 and OSC2 will be powered down when the device enters Sleep mode. Clearing the ROSEL bit allows the reference output frequency to change as the system clock changes during any clock switches.

10.5 Doze Mode

Generally, changing clock speed and invoking one of the power-saving modes are the preferred strategies for reducing power consumption. There may be circumstances, however, where this is not practical. For example, it may be necessary for an application to maintain uninterrupted synchronous communication, even while it is doing nothing else. Reducing system clock speed may introduce communication errors, while using a power-saving mode may stop communications completely.

Doze mode is a simple and effective alternative method to reduce power consumption while the device is still executing code. In this mode, the system clock continues to operate from the same source and at the same speed. Peripheral modules continue to be clocked at the same speed, while the CPU clock speed is reduced. Synchronization between the two clock domains is maintained, allowing the peripherals to access the SFRs while the CPU executes code at a slower rate.

Doze mode is enabled by setting the DOZEN bit (CLKDIV<11>). The ratio between peripheral and core clock speed is determined by the DOZE<2:0> bits (CLKDIV<14:12>). There are eight possible configurations, from 1:1 to 1:128, with 1:1 being the default.

It is also possible to use Doze mode to selectively reduce power consumption in event driven applications. This allows clock-sensitive functions, such as synchronous communications, to continue without interruption. Meanwhile, the CPU Idles, waiting for something to invoke an interrupt routine. Enabling the automatic return to full-speed CPU operation on interrupts is enabled by setting the ROI bit (CLKDIV<15>). By default, interrupt events have no effect on Doze mode operation.

10.6 Selective Peripheral Module Control

Idle and Doze modes allow users to substantially reduce power consumption by slowing or stopping the CPU clock. Even so, peripheral modules still remain clocked, and thus, consume power. There may be cases where the application needs what these modes do not provide: the allocation of power resources to CPU processing with minimal power consumption from the peripherals.

PIC24F devices address this requirement by allowing peripheral modules to be selectively disabled, reducing or eliminating their power consumption. This can be done with two control bits:

- The Peripheral Enable bit, generically named, “XXXEN”, located in the module’s main control SFR.
- The Peripheral Module Disable (PMD) bit, generically named, “XXXMD”, located in one of the PMDx Control registers.

Both bits have similar functions in enabling or disabling its associated module. Setting the PMDx bits for a module, disables all clock sources to that module, reducing its power consumption to an absolute minimum. In this state, the control and status registers associated with the peripheral will also be disabled, so writes to those registers will have no effect, and read values will be invalid. Many peripheral modules have a corresponding PMDx bit.

In contrast, disabling a module by clearing its XXXEN bit, disables its functionality, but leaves its registers available to be read and written to. Power consumption is reduced, but not by as much as when the PMDx bits are used. Most peripheral modules have an enable bit; exceptions include capture, compare and RTCC.

To achieve more selective power savings, peripheral modules can also be selectively disabled when the device enters Idle mode. This is done through the control bit of the generic name format, “XXXIDL”. By default, all modules that can operate during Idle mode will do so. Using the disable on Idle feature disables the module while in Idle mode, allowing further reduction of power consumption during Idle mode, enhancing power savings for extremely critical power applications.

Note 1: These bits are not implemented in 20-pin devices.
2: These bits are not implemented in 28-pin devices.

13.2 General Purpose Timer

Timer mode is selected when CCSEL = 0 and MOD<3:0> = 0000. The timer can function as a 32-bit timer or a dual 16-bit timer, depending on the setting of the T32 bit (Table 13-2).

TABLE 13-2: TIMER OPERATION MODE

T32 (CCPxCON1L<5>)	Operating Mode
0	Dual Timer Mode (16-bit)
1	Timer Mode (32-bit)

Dual 16-Bit Timer mode provides a simple timer function with two independent 16-bit timer/counters. The primary timer uses CCPxTMRL and CCPxPRL. Only the primary timer can interact with other modules on the device. It generates the MCCPx Sync out signals for use by other MCCP modules. It can also use the SYNC<4:0> bits signal generated by other modules.

The secondary timer uses CCPxTMRH and CCPxPRH. It is intended to be used only as a periodic interrupt source for scheduling CPU events. It does not generate an Output Sync/Trigger signal like the primary time base. In Dual Timer mode, the Secondary Timer Period register, CCPxPRH, generates the MCCP Compare Event (CCPxIF) used by many other modules on the device.

The 32-Bit Timer mode uses the CCPxTMRL and CCPxTMRH registers, together, as a single 32-bit timer. When CCPxTMRL overflows, CCPxTMRH increments by one. This mode provides a simple timer function when it is important to track long time periods. Note that the T32 bit (CCPxCON1L<5>) should be set before the CCPxTMRL or CCPxPRH registers are written to initialize the 32-bit timer.

13.2.1 SYNC AND TRIGGER OPERATION

In both 16-bit and 32-bit modes, the timer can also function in either Synchronization (“Sync”) or Trigger operation. Both use the SYNC<4:0> bits (CCPxCON1H<4:0>) to determine the input signal source. The difference is how that signal affects the timer.

In Sync operation, the timer Reset or clear occurs when the input selected by SYNC<4:0> is asserted. The timer immediately begins to count again from zero unless it is held for some other reason. Sync operation is used whenever the TRIGEN bit (CCPxCON1H<7>) is cleared. SYNC<4:0> can have any value except ‘11111’.

In Trigger operation, the timer is held in Reset until the input selected by SYNC<4:0> is asserted; when it occurs, the timer starts counting. Trigger operation is used whenever the TRIGEN bit is set. In Trigger mode, the timer will continue running after a Trigger event as long as the CCPTRIG bit (CCPxSTATL< 7>) is set. To clear CCPTRIG, the TRCLR bit (CCPxSTATL<5>) must be set to clear the Trigger event, reset the timer and hold it at zero until another Trigger event occurs. On PIC24FV16KM204 family devices, Trigger operation can only be used when the system clock is the time base source (CLKSEL<2:0> = 000).

1 = Discontinues module operation when the device enters Idle mode
0 = Continues module operation in Idle mode

bit 12 **IREN:** IrDA® Encoder and Decoder Enable bit(1)
1 = IrDA encoder and decoder are enabled
0 = IrDA encoder and decoder are disabled

bit 11 **RTSMD:** Mode Selection for $\overline{\text{UxRTS}}$ Pin bit
1 = $\overline{\text{UxRTS}}$ pin is in Simplex mode
0 = $\overline{\text{UxRTS}}$ pin is in Flow Control mode

bit 10 **Unimplemented:** Read as '0'

bit 9-8 **UEN<1:0>:** UARTx Enable bits(2)
11 = UxTX, UxRX and UxBCLK pins are enabled and used; $\overline{\text{UxCTS}}$ pin is controlled by port latches
10 = UxTX, UxRX, $\overline{\text{UxCTS}}$ and $\overline{\text{UxRTS}}$ pins are enabled and used
01 = UxTX, UxRX and $\overline{\text{UxRTS}}$ pins are enabled and used; $\overline{\text{UxCTS}}$ pin is controlled by port latches
00 = UxTX and UxRX pins are enabled and used; $\overline{\text{UxCTS}}$ and $\overline{\text{UxRTS}}$/UxBCLK pins are controlled by port latches

bit 7 **WAKE:** Wake-up on Start Bit Detect During Sleep Mode Enable bit
1 = UARTx will continue to sample the UxRX pin; interrupt is generated on the falling edge, bit is cleared in hardware on the following rising edge
0 = No wake-up is enabled

bit 6 **LPBACK:** UARTx Loopback Mode Select bit
1 = Enables Loopback mode
0 = Loopback mode is disabled

bit 5 **ABAUD:** Auto-Baud Enable bit
1 = Enables baud rate measurement on the next character – requires reception of a Sync field (55h); cleared in hardware upon completion
0 = Baud rate measurement is disabled or completed

bit 4 **URXINV:** UARTx Receive Polarity Inversion bit
1 = UxRX Idle state is '0'
0 = UxRX Idle state is '1'

Note 1: This feature is is only available for the 16x BRG mode (BRGH = 0).
2: The bit availability depends on the pin availability.

REGISTER 16-11: RTCCSWT: RTCC CONTROL/SAMPLE WINDOW TIMER REGISTER(1)

R/W-x	R/W-x	R/W-x	R/W-x	R/W-x	R/W-x	R/W-x	R/W-x
PWCSTAB7	PWCSTAB6	PWCSTAB5	PWCSTAB4	PWCSTAB3	PWCSTAB2	PWCSTAB1	PWCSTAB0
bit 15							bit 8

R/W-x	R/W-x	R/W-x	R/W-x	R/W-x	R/W-x	R/W-x	R/W-x
PWCSAMP7	PWCSAMP6	PWCSAMP5	PWCSAMP4	PWCSAMP3	PWCSAMP2	PWCSAMP1	PWCSAMP0
bit 7							bit 0

Legend:			
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 15-8 **PWCSTAB<7:0>:** PWM Stability Window Timer bits

11111111 = Stability window is 255 TPWCCLK clock periods

.

.

.

00000000 = Stability window is 0 TPWCCLK clock periods

The sample window starts when the alarm event triggers. The stability window timer starts counting from every alarm event when PWCEN = 1.

bit 7-0 **PWCSAMP<7:0>:** PWM Sample Window Timer bits

11111111 = Sample window is always enabled, even when PWCEN = 0

11111110 = Sample window is 254 TPWCCLK clock periods

.

.

.

00000000 = Sample window is 0 TPWCCLK clock periods

The sample window timer starts counting at the end of the stability window when PWCEN = 1. If PWCSTAB<7:0> = 00000000, the sample window timer starts counting from every alarm event when PWCEN = 1.

Note 1: A write to this register is only allowed when RTCWREN = 1.

FIGURE 16-2: ALARM MASK SETTINGS

Alarm Mask Setting (AMASK<3:0>)	Day of the Week	Month	Day	Hours	Minutes	Seconds
0000 - Every half second 0001 - Every second						
0010 - Every 10 seconds						s
0011 - Every minute						s s
0100 - Every 10 minutes					m	s s
0101 - Every hour					m m	s s
0110 - Every day				h h	m m	s s
0111 - Every week	d			h h	m m	s s
1000 - Every month			d d	h h	m m	s s
1001 - Every year(1)		m m	d d	h h	m m	s s

Note 1: Annually, except when configured for February 29.

16.5 Power Control

The RTCC includes a power control feature that allows the device to periodically wake-up an external device, wait for the device to be stable before sampling wake-up events from that device and then shut down the external device. This can be done completely autonomously by the RTCC, without the need to wake from the current low-power mode (Sleep, Deep Sleep, etc.).

To enable this feature, the RTCC must be enabled (RTCEN = 1), the PWCEN register bit must be set and the RTCC pin must be driving the PWC control signal (RTCOE = 1 and RTCCLK<1:0> = 11).

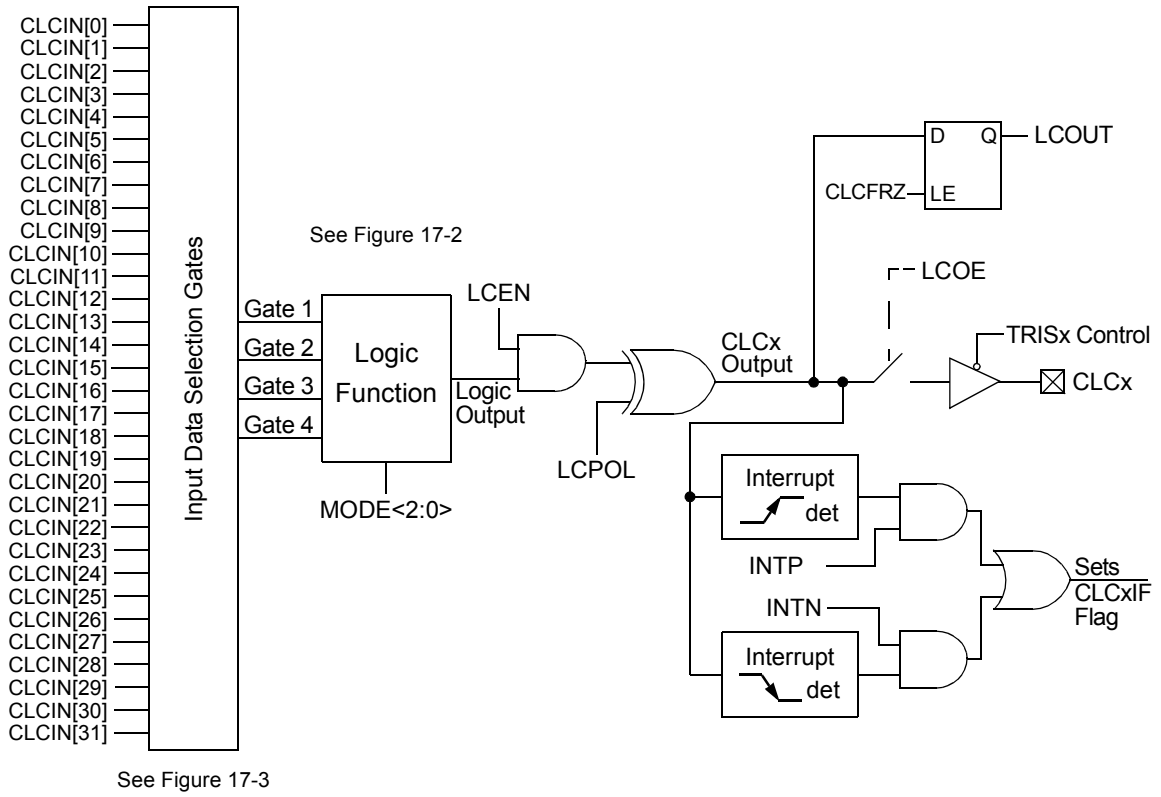
The polarity of the PWC control signal may be chosen using the PWCPOL register bit. Active-low or active-high may be used with the appropriate external switch to turn on or off the power to one or more external devices. The active-low setting may also be used in conjunction with an open-drain setting on the RTCC pin. This setting is able to drive the GND pin(s) of the external device directly (with the appropriate external V_{DD} pull-up device), without the need for external switches. Finally, the CHIME bit should be set to enable the PWC periodicity.

17.0 CONFIGURABLE LOGIC CELL (CLC)

The Configurable Logic Cell (CLC) module allows the user to specify combinations of signals as inputs to a logic function and to use the logic output to control other peripherals or I/O pins. This provides greater flexibility and potential in embedded designs since the CLC module can operate outside the limitations of software execution and supports a vast amount of output designs.

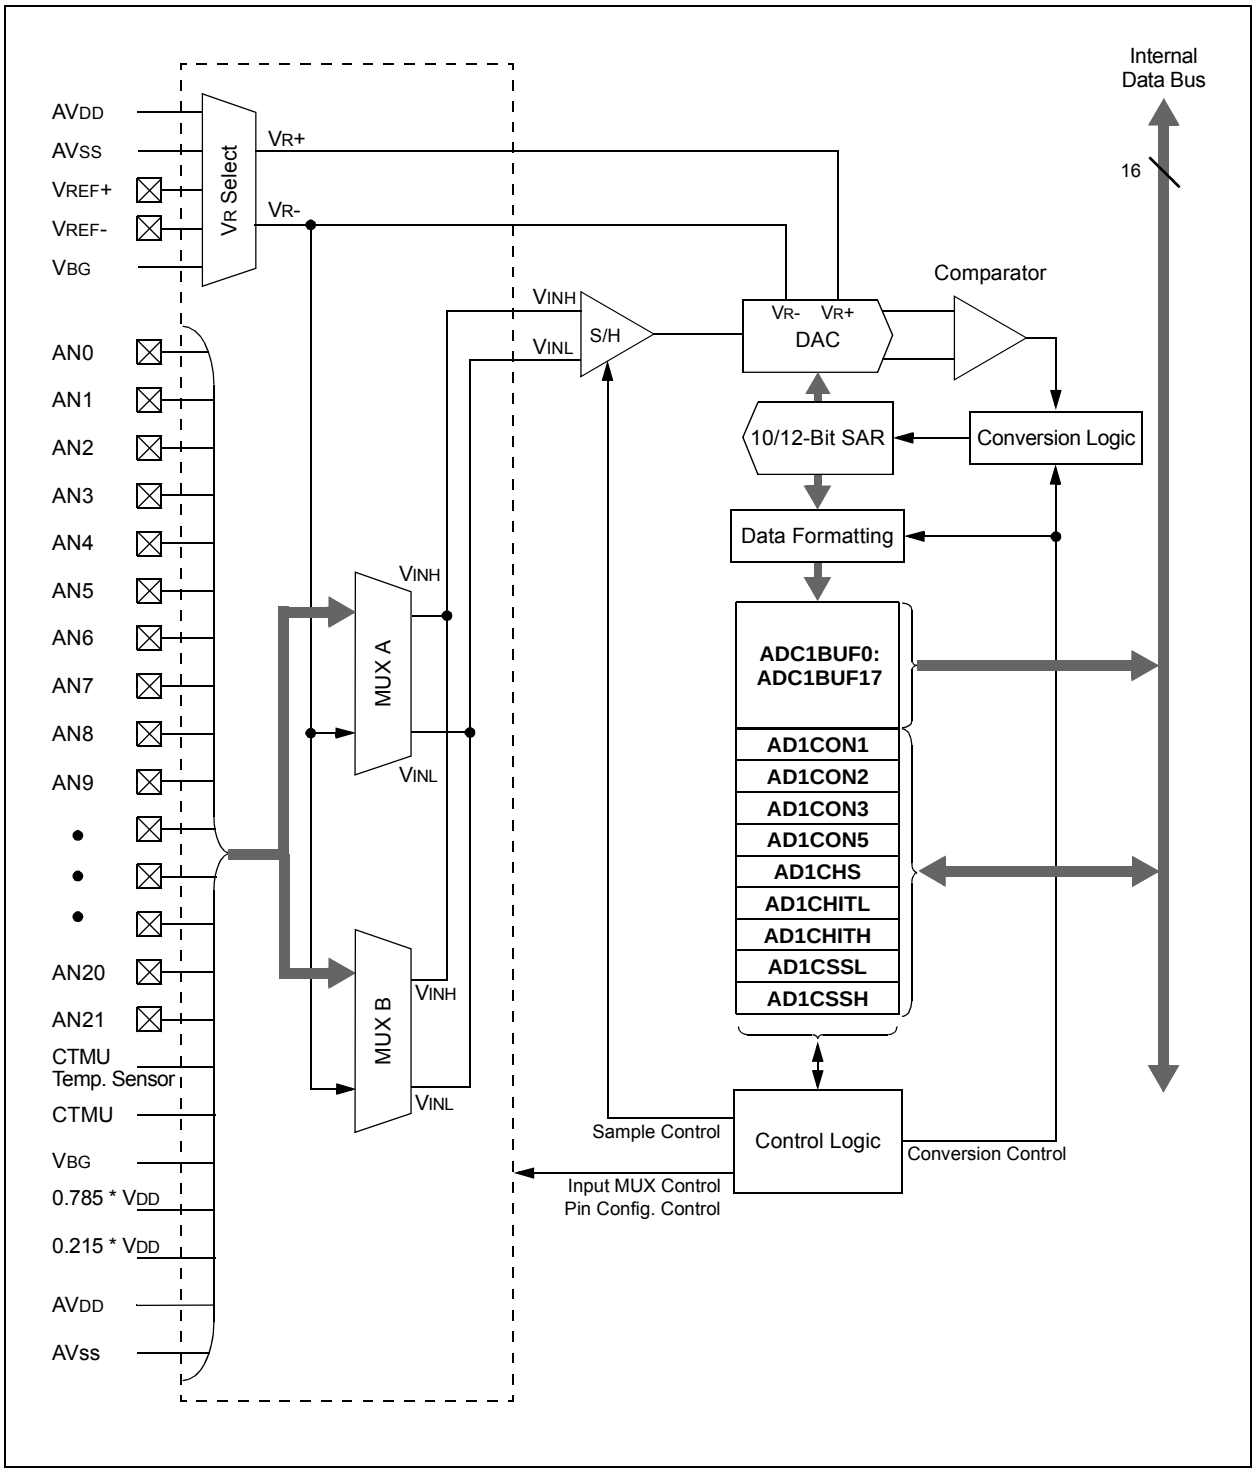
There are four input gates to the selected logic function. These four input gates select from a pool of up to 32 signals that are selected using four data source selection multiplexers. Figure 17-1 shows an overview of the module. Figure 17-3 shows the details of the data source multiplexers and logic input gate connections.

FIGURE 17-1: CLCx MODULE



Note: All register bits shown in this figure can be found in the CLCxCONL register.

FIGURE 19-1: 12-BIT A/D CONVERTER BLOCK DIAGRAM



23.0 COMPARATOR VOLTAGE REFERENCE

Note: This data sheet summarizes the features of this group of PIC24F devices. It is not intended to be a comprehensive reference source. For more information on the Comparator Voltage Reference, refer to the *"PIC24F Family Reference Manual"*, **"Comparator Voltage Reference Module"** (DS39709).

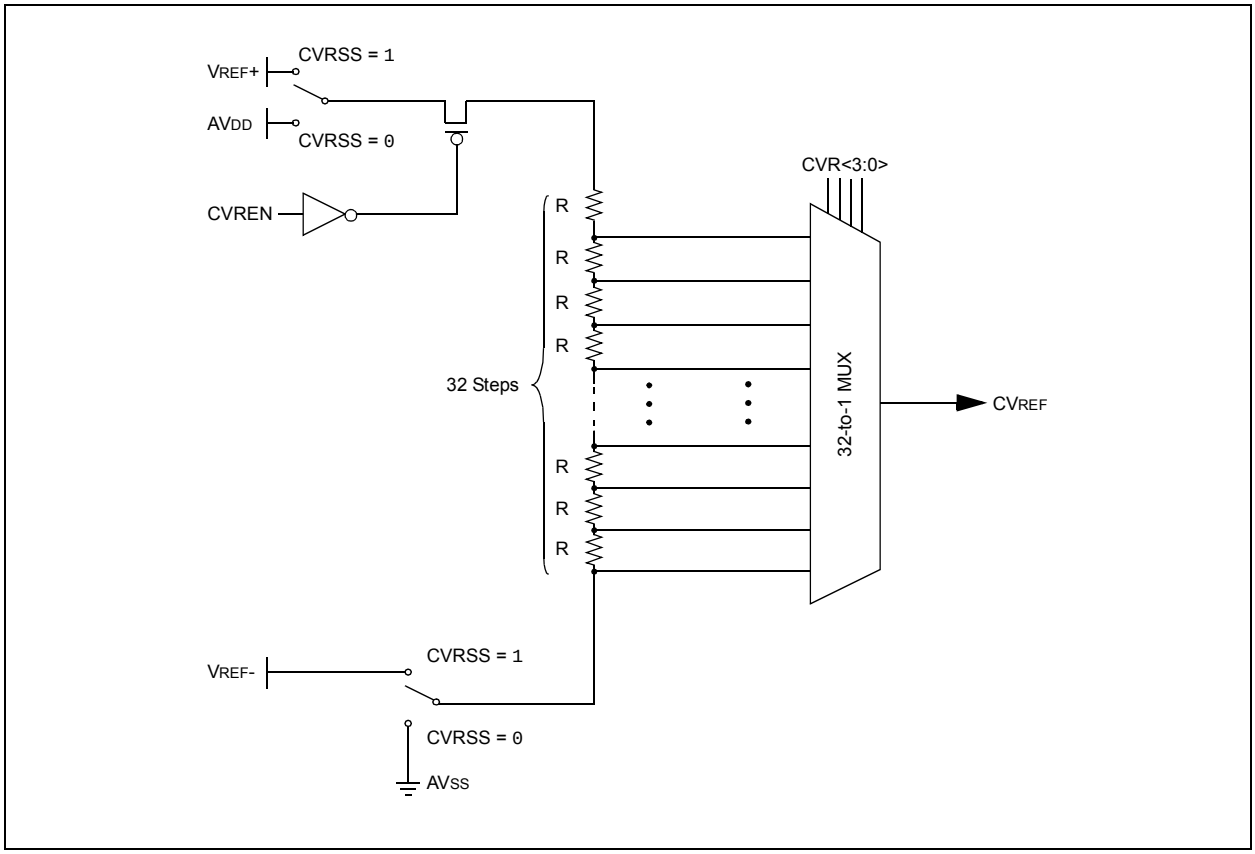
23.1 Configuring the Comparator Voltage Reference

The comparator voltage reference module is controlled through the CVRCON register (Register 23-1). The comparator voltage reference provides a range of output voltages with 32 distinct levels.

The comparator voltage reference supply voltage can come from either VDD and VSS, or the external VREF+ and VREF-. The voltage source is selected by the CVRSS bit (CVRCON<5>).

The settling time of the comparator voltage reference must be considered when changing the CVREF output.

FIGURE 23-1: COMPARATOR VOLTAGE REFERENCE BLOCK DIAGRAM



25.0 SPECIAL FEATURES

Note: This data sheet summarizes the features of this group of PIC24F devices. It is not intended to be a comprehensive reference source. For more information on the Watchdog Timer, High-Level Device Integration and Programming Diagnostics, refer to the individual sections of the *"PIC24F Family Reference Manual"* provided below:

- **"Watchdog Timer (WDT)"** (DS39697)
- **"Programming and Diagnostics"** (DS39716)

PIC24FXXXXX family devices include several features intended to maximize application flexibility and reliability, and minimize cost through elimination of external components. These are:

- Flexible Configuration
- Watchdog Timer (WDT)
- Code Protection
- In-Circuit Serial Programming™ (ICSP™)
- In-Circuit Emulation

25.1 Configuration Bits

The Configuration bits can be programmed (read as '0') or left unprogrammed (read as '1') to select various device configurations. These bits are mapped, starting at program memory location, F80000h. A complete list of Configuration register locations is provided in Table 25-1. A detailed explanation of the various bit functions is provided in Register 25-1 through Register 25-9.

The address, F80000h, is beyond the user program memory space. In fact, it belongs to the configuration memory space (800000h-FFFFFFh), which can only be accessed using Table Reads and Table Writes.

TABLE 25-1: CONFIGURATION REGISTERS LOCATIONS

Configuration Register	Address
FBS	F80000
FGS	F80004
FOSCSEL	F80006
FOSC	F80008
FWDT	F8000A
FPOR	F8000C
FICD	F8000E

REGISTER 25-1: FBS: BOOT SEGMENT CONFIGURATION REGISTER

U-0	U-0	U-0	U-0	R/W-1	R/W-1	R/W-1	R/W-1
—	—	—	—	BSS2	BSS1	BSS0	BWRP
bit 7							bit 0

Legend:			
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 7-4 **Unimplemented:** Read as '0'

bit 3-1 **BSS<2:0>:** Boot Segment Program Flash Code Protection bits
111 = No boot program Flash segment
011 = Reserved
110 = Standard security, boot program Flash segment starts at 200h, ends at 000AFEh
010 = High-security, boot program Flash segment starts at 200h, ends at 000AFEh
101 = Standard security, boot program Flash segment starts at 200h, ends at 0015FEh(1)
001 = High-security, boot program Flash segment starts at 200h, ends at 0015FEh(1)
100 = Reserved
000 = Reserved

bit 0 **BWRP:** Boot Segment Program Flash Write Protection bit
1 = Boot Segment may be written
0 = Boot Segment is write-protected

Note 1: This selection should not be used in PIC24FV08KMXXX devices.

27.2 AC Characteristics and Timing Parameters

The information contained in this section defines the PIC24FV16KM204 family AC characteristics and timing parameters.

TABLE 27-18: TEMPERATURE AND VOLTAGE SPECIFICATIONS – AC

AC CHARACTERISTICS	**Standard Operating Conditions: 1.8V to 3.6V** Operating temperature -40°C ≤ TA ≤ +85°C for Industrial -40°C ≤ TA ≤ +125°C for Extended Operating voltage VDD range as described in **Section 27.1 "DC Characteristics"**.

FIGURE 27-5: LOAD CONDITIONS FOR DEVICE TIMING SPECIFICATIONS

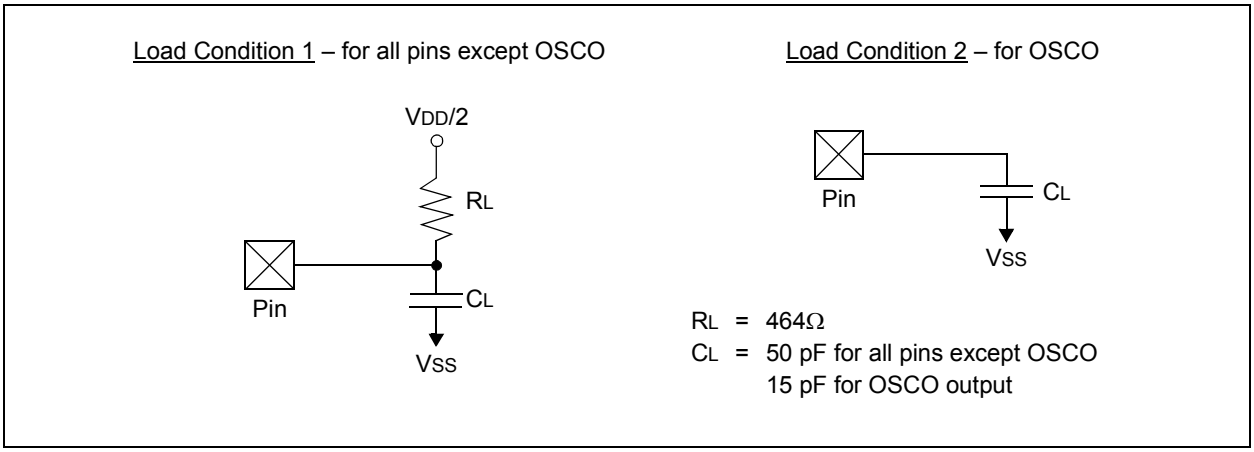


TABLE 27-19: CAPACITIVE LOADING REQUIREMENTS ON OUTPUT PINS

Param No.	Symbol	Characteristic	Min	Typ(1)	Max	Units	Conditions
DO50	COSC2	OSCO/CLKO Pin	—	—	15	pF	In XT and HS modes when External Clock is used to drive OSCI
DO56	CIO	All I/O Pins and OSCO	—	—	50	pF	EC mode
DO58	CB	SCLx, SDAx	—	—	400	pF	In I^2C™ mode

Note 1: Data in "Typ" column is at 3.3V, +25°C unless otherwise stated. Parameters are for design guidance only and are not tested.

TABLE 27-21: PLL CLOCK TIMING SPECIFICATIONS

AC CHARACTERISTICS			Standard Operating Conditions: 1.8V to 3.6V (PIC24F16KM204) 2.0V to 5.5V (PIC24FV16KM204) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial -40°C ≤ TA ≤ +125°C for Extended				
Param No.	**Sym**	**Characteristic(1)**	**Min**	**Typ(2)**	**Max**	**Units**	**Conditions**
OS50	FPLLI	PLL Input Frequency Range	4	—	8	MHz	ECPLL, HSPLL modes, -40°C ≤ TA ≤ +85°C
OS51	FSYS	PLL Output Frequency Range	16	—	32	MHz	-40°C ≤ TA ≤ +85°C
OS52	TLOCK	PLL Start-up Time (Lock Time)	—	1	2	ms	
OS53	DCLK	CLKO Stability (Jitter)	-2	1	2	%	Measured over 100 ms period

Note 1: These parameters are characterized but not tested in manufacturing.

2: Data in "Typ" column is at 3.3V, +25°C unless otherwise stated. Parameters are for design guidance only and are not tested.

TABLE 27-22: INTERNAL RC OSCILLATOR ACCURACY

AC CHARACTERISTICS		Standard Operating Conditions: 1.8V to 3.6V (PIC24F16KM204) 2.0V to 5.5V (PIC24FV16KM204) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial -40°C ≤ TA ≤ +125°C for Extended					
Param No.	**Characteristic**	**Min**	**Typ**	**Max**	**Units**	**Conditions**	
F20	FRC @ 8 MHz(1)	-2	—	+2	%	+25°C	3.0V ≤ VDD ≤ 3.6V, F device 3.2V ≤ VDD ≤ 5.5V, FV device
		-5	—	+5	%	-40°C ≤ TA ≤ +125°C	1.8V ≤ VDD ≤ 3.6V, F device 2.0V ≤ VDD ≤ 5.5V, FV device
F21	LPRC @ 31 kHz(2)	-15	—	+15	%	-40°C ≤ TA ≤ +125°C	1.8V ≤ VDD ≤ 3.6V, F device 2.0V ≤ VDD ≤ 5.5V, FV device

Note 1: The frequency is calibrated at +25°C and 3.3V. The OSCTUN bits can be used to compensate for temperature drift.

2: The change of LPRC frequency as VDD changes.

TABLE 27-23: INTERNAL RC OSCILLATOR SPECIFICATIONS

AC CHARACTERISTICS			Standard Operating Conditions: 1.8V to 3.6V (PIC24F16KM204) 2.0V to 5.5V (PIC24FV16KM204) Operating temperature -40°C ≤ TA ≤ +85°C for Industrial -40°C ≤ TA ≤ +125°C for Extended				
Param No.	**Sym**	**Characteristic**	**Min**	**Typ**	**Max**	**Units**	**Conditions**
	TFRC	FRC Start-up Time	—	5	—	μs	
	TLPRC	LPRC Start-up Time	—	70	—	μs

Microchip Technology Drawing No. C04-2073A

Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as "unbreakable."

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

QUALITY MANAGEMENT SYSTEM
CERTIFIED BY DNV
═ ISO/TS 16949 ═

Microchip received ISO/TS-16949:2009 certification for its worldwide headquarters, design and wafer fabrication facilities in Chandler and Tempe, Arizona; Gresham, Oregon and design centers in California and India. The Company's quality system processes and procedures are for its PIC® MCUs and dsPIC® DSCs, KEELOQ® code hopping devices, Serial EEPROMs, microperipherals, nonvolatile memory and analog products. In addition, Microchip's quality system for the design and manufacture of development systems is ISO 9001:2000 certified.
