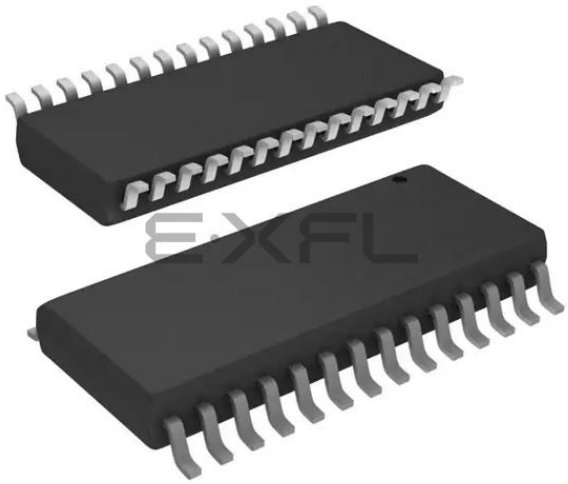
Microchip Technology - PIC24FV16KM202-E/SO Datasheet



Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Active
Core Processor	PIC
Core Size	16-Bit
Speed	32MHz
Connectivity	I²C, IrDA, LINbus, SPI, UART/USART
Peripherals	Brown-out Detect/Reset, LVD, POR, PWM, WDT
Number of I/O	23
Program Memory Size	16KB (5.5K x 24)
Program Memory Type	FLASH
EEPROM Size	512 x 8
RAM Size	2K x 8
Voltage - Supply (Vcc/Vdd)	2V ~ 5V
Data Converters	A/D 19x10b/12b; D/A 2x8b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 125°C (TA)
Mounting Type	Surface Mount
Package / Case	28-SOIC (0.295", 7.50mm Width)
Supplier Device Package	28-SOIC
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/pic24fv16km202-e-so

5.0 FLASH PROGRAM MEMORY

Note: This data sheet summarizes the features of this group of PIC24F devices. It is not intended to be a comprehensive reference source. For more information on Flash programming, refer to the *"PIC24F Family Reference Manual"*, **"Program Memory"** (DS39715).

The PIC24FV16KM204 family of devices contains internal Flash program memory for storing and executing application code. The memory is readable, writable and erasable when operating with VDD over 1.8V.

Flash memory can be programmed in three ways:

- In-Circuit Serial Programming™ (ICSP™)
- Run-Time Self-Programming (RTSP)
- Enhanced In-Circuit Serial Programming (Enhanced ICSP)

ICSP allows a PIC24FXXXXX device to be serially programmed while in the end application circuit. This is simply done with two lines for the programming clock and programming data (which are named PGECx and PGEDx, respectively), and three other lines for power (VDD), ground (VSS) and Master Clear/Program Mode Entry Voltage (MCLR/VPP). This allows customers to manufacture boards with unprogrammed devices and then program the microcontroller just before shipping the product. This also allows the most recent firmware or custom firmware to be programmed.

Run-Time Self-Programming (RTSP) is accomplished using TBLRD (Table Read) and TBLWT (Table Write) instructions. With RTSP, the user may write program memory data in blocks of 32 instructions (96 bytes) at a time, and erase program memory in blocks of 32, 64 and 128 instructions (96,192 and 384 bytes) at a time.

The NVMOP<1:0> (NVMCON<1:0>) bits decide the erase block size.

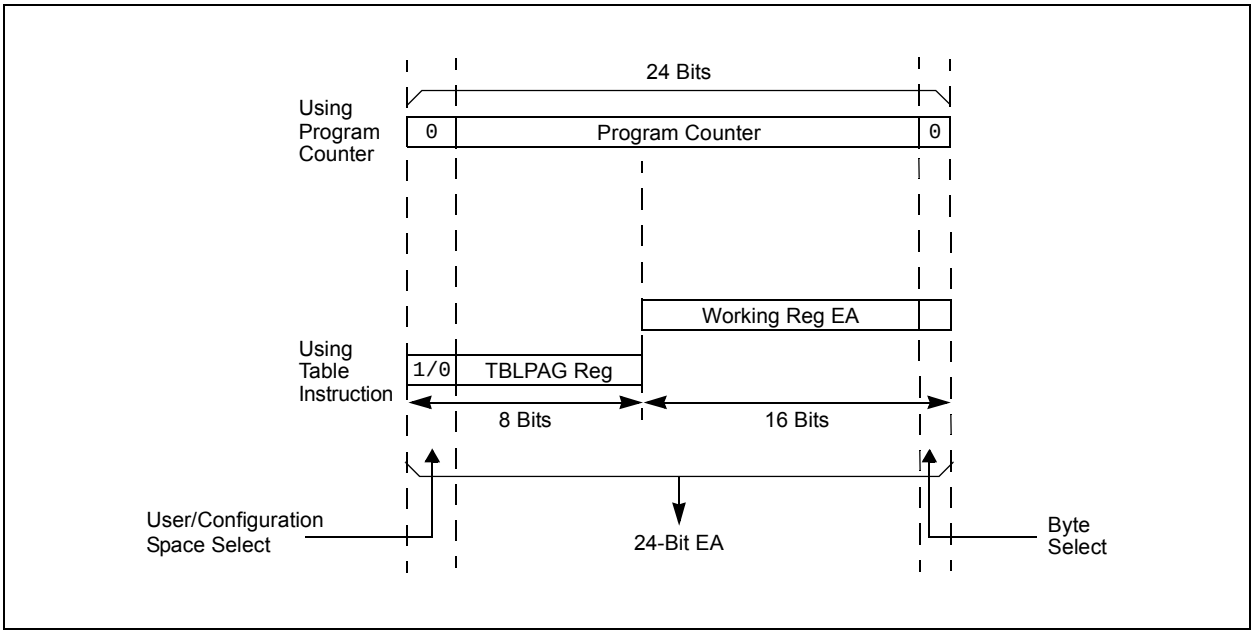
5.1 Table Instructions and Flash Programming

Regardless of the method used, Flash memory programming is done with the Table Read and Write instructions. These allow direct read and write access to the program memory space from the data memory while the device is in normal operating mode. The 24-bit target address in the program memory is formed using the TBLPAG<7:0> bits and the Effective Address (EA) from a W register, specified in the table instruction, as depicted in Figure 5-1.

The TBLRDL and the TBLWTL instructions are used to read or write to bits<15:0> of program memory. TBLRDL and TBLWTL can access program memory in both Word and Byte modes.

The TBLRDH and TBLWTH instructions are used to read or write to bits<23:16> of program memory. TBLRDH and TBLWTH can also access program memory in Word or Byte mode.

FIGURE 5-1: ADDRESSING FOR TABLE REGISTERS



7.4.2 SOFTWARE ENABLED BOR

When BOREN<1:0> = 01, the BOR can be enabled or disabled by the user in software. This is done with the control bit, SBOREN (RCON<13>). Setting SBOREN enables the BOR to function as previously described. Clearing the SBOREN disables the BOR entirely. The SBOREN bit operates only in this mode; otherwise, it is read as '0'.

Placing BOR under software control gives the user the additional flexibility of tailoring the application to its environment without having to reprogram the device to change the BOR configuration. It also allows the user to tailor the incremental current that the BOR consumes. While the BOR current is typically very small, it may have some impact in low-power applications.

Note:	Even when the BOR is under software control, the Brown-out Reset voltage level is still set by the BORV<1:0> Configuration bits; it can not be changed in software.

7.4.3 DETECTING BOR

When BOR is enabled, the BOR bit (RCON<1>) is always reset to '1' on any BOR or POR event. This makes it difficult to determine if a BOR event has occurred just by reading the state of BOR alone. A more reliable method is to simultaneously check the state of both POR and BOR. This assumes that the POR and BOR bits are reset to '0' in the software immediately after any POR event. If the BOR bit is '1' while POR is '0', it can be reliably assumed that a BOR event has occurred.

7.4.4 DISABLING BOR IN SLEEP MODE

When BOREN<1:0> = 10, BOR remains under hardware control and operates as previously described. However, whenever the device enters Sleep mode, BOR is automatically disabled. When the device returns to any other operating mode, BOR is automatically re-enabled.

This mode allows for applications to recover from brown-out situations, while actively executing code, when the device requires BOR protection the most. At the same time, it saves additional power in Sleep mode by eliminating the small incremental BOR current.

Note:	BOR levels differ depending on device type; PIC24FV16KM204 devices are at different levels than those of PIC24F16KM204 devices. See **Section 27.0 "Electrical Characteristics"** for BOR voltage levels.

NOTES:

REGISTER 9-1: OSCCON: OSCILLATOR CONTROL REGISTER (CONTINUED)

bit 7 **CLKLOCK:** Clock Selection Lock Enable bit
If FSCM is Enabled (FCKSM1 = 1):
1 = Clock and PLL selections are locked
0 = Clock and PLL selections are not locked and may be modified by setting the OSWEN bit
If FSCM is Disabled (FCKSM1 = 0):
Clock and PLL selections are never locked and may be modified by setting the OSWEN bit.

bit 6 **Unimplemented:** Read as '0'

bit 5 **LOCK:** PLL Lock Status bit(2)
1 = PLL module is in lock or PLL module start-up timer is satisfied
0 = PLL module is out of lock, PLL start-up timer is running or PLL is disabled

bit 4 **Unimplemented:** Read as '0'

bit 3 **CF:** Clock Fail Detect bit
1 = FSCM has detected a clock failure
0 = No clock failure has been detected

bit 2 **SOSCDRV**: Secondary Oscillator Drive Strength bit(3)
1 = High-power SOSC circuit is selected
0 = Low/high-power select is done via the SOSCSRC Configuration bit

bit 1 **SOSCEN:** 32 kHz Secondary Oscillator (SOSC) Enable bit
1 = Enables the Secondary Oscillator
0 = Disables the Secondary Oscillator

bit 0 **OSWEN:** Oscillator Switch Enable bit
1 = Initiates an oscillator switch to the clock source specified by the NOSC<2:0> bits
0 = Oscillator switch is complete

Note 1: Reset values for these bits are determined by the FNOSCx Configuration bits.
2: This bit also resets to '0' during any valid clock switch or whenever a non-PLL Clock mode is selected.
3: When SOSC is selected to run from a digital clock input, rather than an external crystal (SOSCSRC = 0), this bit has no effect.

-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 15-8 **Unimplemented:** Read as '0'

bit 7 **WCOL:** Write Collision Detect bit
1 = The SSPxBUF register is written while it is still transmitting the previous word (must be cleared in software)
0 = No collision

bit 6 **SSPOV:** Master Synchronous Serial Port Receive Overflow Indicator bit(1)
SPI Slave mode:
1 = A new byte is received while the SSPxBUF register is still holding the previous data. In case of overflow, the data in SSPxSR is lost. Overflow can only occur in Slave mode. The user must read the SSPxBUF, even if only transmitting data, to avoid setting overflow (must be cleared in software).
0 = No overflow

bit 5 **SSPEN:** Master Synchronous Serial Port Enable bit(2)
1 = Enables the serial port and configures SCKx, SDOx, SDIx and $\overline{SSx}$ as serial port pins
0 = Disables the serial port and configures these pins as I/O port pins

bit 4 **CKP:** Clock Polarity Select bit
1 = Idle state for clock is a high level
0 = Idle state for clock is a low level

bit 3-0 **SSPM<3:0>:** Master Synchronous Serial Port Mode Select bits(3)
1010 = SPI Master mode, Clock = FOSC/(2 * ([SSPxADD] + 1))
0101 = SPI Slave mode, Clock = SCKx pin; $\overline{SSx}$ pin control is disabled, $\overline{SSx}$ can be used as an I/O pin
0100 = SPI Slave mode, Clock = SCKx pin; $\overline{SSx}$ pin control is enabled
0011 = SPI Master mode, Clock = TMR2 output/2
0010 = SPI Master mode, Clock = FOSC/32
0001 = SPI Master mode, Clock = FOSC/8
0000 = SPI Master mode, Clock = FOSC/2

Note 1: In Master mode, the overflow bit is not set since each new reception (and transmission) is initiated by writing to the SSPxBUF register.
2: When enabled, these pins must be properly configured as inputs or outputs.
3: Bit combinations not specifically listed here are either reserved or implemented in I^2C™ mode only.

R/W-x	R/W-x	R/W-x	R/W-x	R/W-x	R/W-x	R/W-x	R/W-x
PWCSAMP7	PWCSAMP6	PWCSAMP5	PWCSAMP4	PWCSAMP3	PWCSAMP2	PWCSAMP1	PWCSAMP0
bit 7							bit 0

Legend:			
R = Readable bit	W = Writable bit	U = Unimplemented bit, read as '0'	
-n = Value at POR	'1' = Bit is set	'0' = Bit is cleared	x = Bit is unknown

bit 15-8 **PWCSTAB<7:0>:** PWM Stability Window Timer bits

11111111 = Stability window is 255 TPWCCLK clock periods

.

.

.

00000000 = Stability window is 0 TPWCCLK clock periods

The sample window starts when the alarm event triggers. The stability window timer starts counting from every alarm event when PWCEN = 1.

bit 7-0 **PWCSAMP<7:0>:** PWM Sample Window Timer bits

11111111 = Sample window is always enabled, even when PWCEN = 0

11111110 = Sample window is 254 TPWCCLK clock periods

.

.

.

00000000 = Sample window is 0 TPWCCLK clock periods

The sample window timer starts counting at the end of the stability window when PWCEN = 1. If PWCSTAB<7:0> = 00000000, the sample window timer starts counting from every alarm event when PWCEN = 1.

Note 1: A write to this register is only allowed when RTCWREN = 1.

bit 3-0 **REV<3:0>:** Minor Revision Identifier bits

25.4 Program Verification and Code Protection

For all devices in the PIC24FXXXXX family, code protection for the Boot Segment is controlled by the Configuration bit, BSS0, and the General Segment by the Configuration bit, GCP. These bits inhibit external reads and writes to the program memory space This has no direct effect in normal execution mode.

Write protection is controlled by bit, BWRP, for the Boot Segment and bit, GWRP, for the General Segment in the Configuration Word. When these bits are programmed to '0', internal write and erase operations to program memory are blocked.

25.5 In-Circuit Serial Programming

PIC24FXXXXX family microcontrollers can be serially programmed while in the end application circuit. This is simply done with two lines for clock (PGECx) and data (PGEDx), and three other lines for power, ground and the programming voltage. This allows customers to manufacture boards with unprogrammed devices and then program the microcontroller just before shipping the product. This also allows the most recent firmware or a custom firmware to be programmed.

25.6 In-Circuit Debugger

When MPLAB® ICD 3, MPLAB REAL ICE™ or PICkit™ 3 is selected as a debugger, the in-circuit debugging functionality is enabled. This function allows simple debugging functions when used with MPLAB IDE. Debugging functionality is controlled through the PGECx and PGEDx pins.

To use the in-circuit debugger function of the device, the design must implement ICSP connections to $\overline{MCLR}$, V_{DD}, V_{SS}, PGECx, PGEDx and the pin pair. In addition, when the feature is enabled, some of the resources are not available for general use. These resources include the first 80 bytes of data RAM and two I/O pins.

TABLE 27-1: THERMAL OPERATING CONDITIONS

Rating	Symbol	Min	Typ	Max	Unit
Operating Junction Temperature Range	T_J	-40	—	+140	°C
Operating Ambient Temperature Range	T_A	-40	—	+125	°C
Power Dissipation Internal Chip Power Dissipation: $P_{INT} = V_{DD} \times (I_{DD} - \Sigma I_{OH})$ I/O Pin Power Dissipation: $P_{I/O} = \Sigma (\{V_{DD} - V_{OH}\} \times I_{OH}) + \Sigma (V_{OL} \times I_{OL})$	P_D	$P_{INT} + P_{I/O}$			W
Maximum Allowed Power Dissipation	P_{DMAX}	$(T_J - T_A)/\theta_{JA}$			W

TABLE 27-2: THERMAL PACKAGING CHARACTERISTICS

Characteristic	Symbol	Typ	Max	Unit	Notes
Package Thermal Resistance, 20-Pin PDIP	θ_{JA}	62.4	—	°C/W	**1**
Package Thermal Resistance, 28-Pin SPDIP	θ_{JA}	60	—	°C/W	**1**
Package Thermal Resistance, 20-Pin SSOP	θ_{JA}	108	—	°C/W	**1**
Package Thermal Resistance, 28-Pin SSOP	θ_{JA}	71	—	°C/W	**1**
Package Thermal Resistance, 20-Pin SOIC	θ_{JA}	75	—	°C/W	**1**
Package Thermal Resistance, 28-Pin SOIC	θ_{JA}	80.2	—	°C/W	**1**
Package Thermal Resistance, 20-Pin QFN	θ_{JA}	43	—	°C/W	**1**
Package Thermal Resistance, 28-Pin QFN	θ_{JA}	32	—	°C/W	**1**
Package Thermal Resistance, 44-Pin QFN	θ_{JA}	29	—	°C/W	**1**
Package Thermal Resistance, 44-Pin TQFP	θ_{JA}	40	—	°C/W	**1**
Package Thermal Resistance, 48-Pin UQFN	θ_{JA}	41	—	°C/W	**1**

Note 1: Junction to ambient thermal resistance, Theta-$_{JA}$ (θ_{JA}) numbers are achieved by package simulations.

TABLE 27-3: DC CHARACTERISTICS: TEMPERATURE AND VOLTAGE SPECIFICATIONS

DC CHARACTERISTICS			**Standard Operating Conditions: 1.8V to 3.6V (PIC24F16KMXXX)** **2.0V to 5.5V (PIC24FV16KMXXX)** Operating temperature -40°C ≤ T_A ≤ +85°C for Industrial -40°C ≤ T_A ≤ +125°C for Extended				
Param No.	**Symbol**	**Characteristic**	**Min**	**Typ(1)**	**Max**	**Units**	**Conditions**
DC10	V_{DD}	**Supply Voltage**	1.8	—	3.6	V	For PIC24F devices
			2.0	—	5.5	V	For PIC24FV devices
DC12	V_{DR}	**RAM Data Retention Voltage(2)**	1.6	—	—	V	For PIC24F devices
			1.8	—	—	V	For PIC24FV devices
DC16	V_{POR}	**V_{DD} Start Voltage** to Ensure Internal Power-on Reset Signal	V_{SS}	—	0.7	V	
DC17	SV_{DD}	**V_{DD} Rise Rate** to Ensure Internal Power-on Reset Signal	0.05	—	—	V/ms	0-3.3V in 0.1s 0-2.5V in 60 ms

Note 1: Data in "Typ" column is at 3.3V, +25°C unless otherwise stated. Parameters are for design guidance only and are not tested.

2: This is the limit to which V_{DD} can be lowered without losing RAM data.

Notes:

1. Pin 1 visual index feature may vary, but must be located within the hatched area.
2. Package is saw singulated
3. Dimensioning and tolerancing per ASME Y14.5M

   BSC: Basic Dimension. Theoretically exact value shown without tolerances.

   REF: Reference Dimension, usually without tolerance, for information purposes only.

Microchip Technology Drawing C04-103C Sheet 2 of 2

Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as "unbreakable."

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

QUALITY MANAGEMENT SYSTEM
CERTIFIED BY DNV
═ ISO/TS 16949 ═

Microchip received ISO/TS-16949:2009 certification for its worldwide headquarters, design and wafer fabrication facilities in Chandler and Tempe, Arizona; Gresham, Oregon and design centers in California and India. The Company's quality system processes and procedures are for its PIC® MCUs and dsPIC® DSCs, KEELOQ® code hopping devices, Serial EEPROMs, microperipherals, nonvolatile memory and analog products. In addition, Microchip's quality system for the design and manufacture of development systems is ISO 9001:2000 certified.
